# REST framework

The Quark Publishing Platform REST interface lets you access the Platform's functionality using simple HTTP requests. Rather than having to depend on complex remote access libraries such as RMI and SOAP, you can directly invoke functionality and access resources via HTTP and take advantage of standard HTTP mechanisms for transport, session management, security, and error handling. In response to REST calls, the Platform returns any requested data as XML, HTML, or a binary resource stream. If an error occurs, the Platform returns an XML response with an error message and a complete stack trace.

REST URL pattern used in Quark Publishing Platform is:

```
http://server:port/rest/service/typeofcall/resource?op=[value] & [parameter 1]=[value1]
```

For secure access to these requests, the platform server should be configured with SSL. Please refer to the “Enabling SSL for Quark Publishing Platform Web applications” chapter in the **System Admin Guide** in order to learn how to configure the Platform server with SSL.

- ➔ Request parameters, including *op* are not required for all calls.
- ➔ The REST framework is extensible, so you can expose custom services over HTTP.

REST requests return XML responses (by default) or a binary file. The schema of the XML response is specific to the request. These schemas with examples are available in the “[Request parameter formats](#)” chapter.

For all requests that return XML you can add an additional parameter (i.e. `view=jsonView`) to return json instead of an XML response.

You can also apply formatting to returned XML by passing a `view` parameter that points to an XSL transformation or a .jsp page that generates HTML from the XML. The following example points to a .jsp page. This example can be used with a request that returns a search result:

```
http://[server]:[port]/[type of call]?view=thumbnail
```

This example can be used with a request that returns a search result.

Sample .jsp files are provided in the Quark Publishing Platform application folder at `QPP Server/webapps/rest/jsp`

- ➔ Users can add their own .jsp file to this folder.

To use custom XSLT, you need to write a custom bean and specify the path of the XSLT file. The XSLT file can be anywhere. The classpath/file location must be mentioned in the bean definition.

## REST FRAMEWORK

Already defined beans allowing you to view responses using XSLT can be found here:

```
http://ServerName:ServerPort/rest/service/sessions?view=sessionXsltView
```

Support for Transit Session by providing QPP sessionId or username, password as request parameters. User can make a request to server without logging-in by adding request parameters loginname, loginpassword in their requests. Value for loginname and loginpassword would be the username and password of the user. Another request parameter qppsessionid can be used by providing valid qpp session id.

### Session management with REST interface

The following types of sessions can be managed using the REST interface:

- Transient sessions - these sessions are not actively managed they are created just for the time period it takes to work on a request.

Users can receive support for a transient session by providing the Quark Publishing Platform's **sessionId**, **username** or **password** as request parameters. Users can make a request to the server without logging-in by adding **loginname** and **loginpassword** as request parameters.

- ➡ Values for **loginname** and **loginpassword** would be the **username** and **password** of the user.

The request parameter, **qppsessionid** can be used by providing a valid Platform session id.

- Stateful sessions

Create a stateful session by using the Session Management service. A stateful session created with this approach will last for the maximum idle time. The session can be kept alive by using the **keepsessionalive** request. When working with the session, a user does not need to pass the **qppsessionid** parameter to all requests for the session just created.

### HTTP GET and POST Requests

You access the API and manipulate resources by using standard REST conventions. Each API method is invoked using one of the following HTTP methods:

- **GET** - performs a read operation

**GET** is for retrieving data. When you use the **GET** method, the browser encodes form data into a URL. Use the **GET** method only when the form processing is important.

- **POST** - performs a create operation.

**POST** can involve storing or updating data. When you use the **POST** method, form data is passed within the message body.

# Request/Response parameter formats

Some response and request parameters require an XML body. The format for such parameters is described in the following table.

The same request parameters can also be sent in JSON format.

In order to pass request parameters in JSON format, either a request parameter or a request header with the name `qpp-content-type` can be passed in the request.

Following is the fallback sequence used for resolving the `qpp-content-type`:

1. Request Header `qpp-content-type`.
2. Request Parameter `qpp-content-type`.
3. Auto detection by Tika.

If none of the above resolves to the correct content type, the default value used is XML.

→ Response in JSON format already exists by specifying extra request parameter `view=jsonView` in the REST request.

Object Name	Schema Definition	Example
<code>assetRelationInfo</code>	<pre>&lt;xs:element   name="assetRelationInfo"&gt; &lt;xs:complexType&gt; &lt;xs:sequence&gt; &lt;xs:element   ref="attributeValueList" /&gt; &lt;/xs:sequence&gt; &lt;xs:attribute   name="id" type="xs:long"   use="optional" /&gt; &lt;xs:attribute   name="parentAssetId"   type="xs:long" use="optional"   default="0" /&gt; &lt;xs:attribute   name="parentAssetName"   type="xs:string"   use="optional"/&gt; &lt;xs:attribute   name="childAssetId"   type="xs:long" use="optional" /&gt; &lt;xs:attribute   name="childAssetName"   type="xs:string" use="optional"</pre>	<p><b>XML based relations: XML Component Reference</b></p> <pre>&lt;assetRelationInfoList &gt; &lt;assetRelationInfo   relationType= "XML   Component Reference"   childAssetId="227"   parentAssetId="225"&gt; &lt;attributeValueList&gt; &lt;attributeValue   id="417"&gt; xpathValue &lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetRelationInfo&gt; &lt;/assetRelationInfoList &gt;</pre> <p><b>Primary Attachment:</b></p>

## REQUEST/RESPONSE PARAMETER FORMATS

Object Name	Schema Definition	Example
	<pre> /&gt; &lt;xs:attribute name="childAssetMajorVersion" type="xs:long" use="optional" default="0"/&gt; &lt;xs:attribute name="childAssetMinorVersion" type="xs:long" use="optional" default="0"/&gt; &lt;xs:attribute name="relationType" type="xs:string" use="optional" default="" /&gt; &lt;xs:attribute name="relationTypeId" type="xs:long" use="optional" default="0" /&gt; &lt;xs:attribute name="relationState" type="xs:string" use="optional" /&gt; &lt;xs:attribute name="relationStateId" type="xs:int" use="optional" /&gt; &lt;xs:attribute name="lockedToChildVersion" type="xs:boolean" use="optional" default="false"/&gt; &lt;/xs:complexType&gt; &lt;/xs:element&gt;</pre>	<pre> &lt;attributeValueList&gt; &lt;attributeValue id="401"&gt; 1 &lt;/attributeValue&gt; &lt;attributeValue id="402"&gt; 5 &lt;/attributeValue&gt; &lt;attributeValue id="403"&gt; 1 &lt;/attributeValue&gt; &lt;attributeValue id="404"&gt; 1 &lt;/attributeValue&gt; &lt;attributeValue id="412"&gt; 1 &lt;/attributeValue&gt; &lt;/attributeValueList&gt;</pre>
assetRelationInfoList	<pre> &lt;xs:element name="assetRelationInfoList"&gt; &lt;xs:complexType&gt; &lt;xs:sequence&gt; &lt;xs:element maxOccurs="unbounded" ref="assetRelationInfo" /&gt; &lt;/xs:sequence&gt; &lt;/xs:complexType&gt; &lt;/xs:element&gt;</pre>	<p><b>XML based relations: XML Component Reference</b></p> <pre> &lt;assetRelationInfoList&gt;   &lt;assetRelationInfo     relationType= "XML Component Reference"     childAssetId="227"     parentAssetId="225"&gt;     &lt;attributeValueList&gt;       &lt;attributeValue         id="417"&gt; xpathValue       &lt;/attributeValue&gt;     &lt;/attributeValueList&gt;   &lt;/assetRelationInfo&gt; &lt;/assetRelationInfoList&gt;</pre> <p><b>Primary Attachment:</b></p> <pre> &lt;attributeValueList&gt; &lt;attributeValue id="401"&gt; 1 &lt;/attributeValue&gt; &lt;attributeValue id="402"&gt; 5 &lt;/attributeValue&gt;</pre>

Object Name	Schema Definition	Example
		<pre>&lt;attributeValue   id="403"&gt; 1 &lt;/attributeValue&gt; &lt;attributeValue   id="404"&gt; 1 &lt;/attributeValue&gt; &lt;attributeValue   id="412"&gt; 1 &lt;/attributeValue&gt; &lt;/attributeValueList&gt;</pre>
attributeValue	<pre>&lt;xs:element   name="attributeValue"&gt; &lt;xs:complexType&gt; &lt;xs:simpleContent&gt; &lt;xs:extension   base="xs:string"&gt; &lt;xs:attribute   name="id" type="xs:long"   use="optional" default="0"/&gt; &lt;xs:attribute name="name"   type="xs:string" use="optional"   default="" /&gt; &lt;xs:attribute   name="type" type="xs:string"   use="optional" default="" /&gt; &lt;/xs:extension&gt; &lt;/xs:simpleContent&gt; &lt;/xs:complexType&gt; &lt;/xs:element&gt; &lt;xs:element   name="attributeValueList"&gt; &lt;xs:complexType&gt; &lt;xs:sequence&gt; &lt;xs:element   maxOccurs="unbounded"   ref="attributeValue" /&gt; &lt;/xs:sequence&gt; &lt;/xs:complexType&gt; &lt;/xs:element&gt;</pre>	<pre>&lt;attributeValue   id="2"&gt; Hydra.jpg &lt;/attributeValue&gt; &lt;attributeValue   name="workflow"&gt; publish &lt;/attributeValue&gt; &lt;attributeValue   id="55"&gt; 1 &lt;/attributeValue&gt;</pre>
attributeValueList	<pre>&lt;xs:element   name="attributeValueList"&gt; &lt;xs:complexType&gt; &lt;xs:sequence&gt; &lt;xs:element ref="attributeValue"   maxOccurs="unbounded" /&gt; &lt;/xs:sequence&gt; &lt;/xs:complexType&gt; &lt;/xs:element&gt;</pre>	<pre>&lt;attributeValueList&gt; &lt;attributeValue   valueId="0"   type="numeric"   name="Id" id="1"&gt; 222 &lt;/attributeValue&gt; &lt;attributeValue   valueId="0"   type="text"   name="Name" id="2"&gt; 1511623dd8c_Duplicate. qxp &lt;/attributeValue&gt; &lt;attributeValue   valueId="0"   type="dateTime"</pre>

## REQUEST/RESPONSE PARAMETER FORMATS

Object Name	Schema Definition	Example
		<pre> name="Created" id="3"&gt; 2013-10-16T06:19:38Z &lt;/attributeValue&gt; &lt;attributeValue valueId="0" type="dateTime" name="Last modified" id="4"&gt; 2013-10- 16T06:19:38Z &lt;/attributeValue&gt; &lt;attributeValue valueId="1" type="popup" name="Creator" id="5"&gt; Admin &lt;/attributeValue&gt; ..... &lt;/attributeValueList&gt;</pre>
domainValue	<pre> &lt;xs:element name="domainValue"&gt; &lt;xs:complexType&gt; &lt;xs:sequence&gt; &lt;xs:element name="name" type="xs:string"/&gt; &lt;xs:element name="valueHierarchy" type="xs:string"/&gt; &lt;xs:element ref="domainValueList"&gt; &lt;xs:element name="name" type="xs:string"/&gt; &lt;xs:element name="valueHierarchy" type="xs:string"/&gt; &lt;/xs:domainValueList&gt; &lt;/xs:sequence&gt; &lt;/xs:complexType&gt; &lt;/xs:element&gt;</pre>	<pre> &lt;domainValue id ="1"&gt; &lt;name&gt;Desktop&lt;/name&gt; &lt;valueHierarchy&gt; Desktop &lt;/valueHierarchy&gt; &lt;domainValueList&gt; &lt;domainValue id="2"&gt; &lt;name&gt;Research&lt;/name&gt; &lt;valueHierarchy&gt; Desktop;Research &lt;/valueHierarchy&gt; &lt;/domainValue&gt; &lt;domainValue id="3"&gt; &lt;name&gt;Development&lt;/nam e&gt; &lt;valueHierarchy&gt; Desktop;Development &lt;/valueHierarchy&gt; &lt;/domainValue&gt; &lt;/domainValueList&gt; &lt;/domainValue&gt;</pre>
groupInfo	<pre> &lt;xs:element name="groupInfo"&gt; &lt;xs:complexType&gt; &lt;xs:sequence&gt; &lt;xs:element name="name" type="xs:string"/&gt; &lt;xs:element name="emailAddress" type="xs:string"/&gt; &lt;xs:element name="nativeTrustee" type="xs:boolean"/&gt; &lt;xs:element name="defaultUserClassId" type="xs:int"/&gt; &lt;xs:element</pre>	<pre> &lt;groupInfo id ="61"&gt; &lt;name&gt;Editors&lt;/name&gt; &lt;emailAddress&gt; Editors@quark.com &lt;/emailAddress&gt; &lt;nativeTrustee&gt; false &lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt; 2 &lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;</pre>

Object Name	Schema Definition	Example
	<pre> name="defaultUserClass" type="xs:string"/&gt; &lt;xs:element name="ldapProfileId" type="xs:int"/&gt; &lt;xs:element name="ldapProfile" type="xs:string"/&gt; &lt;xs:element name="ldapDistinguishedName" type="xs:string"/&gt; &lt;xs:element ref="memberList"&gt;&gt; &lt;xs:element name="nameId" &lt;/xs:memberList&gt; &lt;/xs:sequence&gt; &lt;/xs:complexType&gt; &lt;/xs:element&gt;</pre>	<pre> NoPrivileges &lt;/defaultUserClass&gt; &lt;ldapProfileId&gt; 10 &lt;/ldapProfileId&gt; &lt;ldapProfile&gt; Profile &lt;/ldapProfile&gt; &lt;ldapDistinguishedName &gt; DN &lt;/ldapDistinguishedName &gt; &lt;memberList&gt; &lt;nameId id="62"&gt; &lt;name&gt;John&lt;/name &gt; &lt;/nameId&gt; &lt;/memberList&gt; &lt;/groupInfo&gt;</pre>

## REQUEST/RESPONSE PARAMETER FORMATS

Object Name	Schema Definition	Example
powerPointSlideInfoList	<pre> &lt;xs:element name="powerPointSlideInfoList"&gt; &lt;xs:complexType&gt; &lt;xs:sequence&gt; &lt;xs:element ref="powerPointSlideInfo" maxOccurs="unbounded"/&gt; &lt;/xs:sequence&gt; &lt;/xs:complexType&gt; &lt;/xs:element&gt;</pre>	<pre> &lt;powerPointSlideInfoLi st&gt; &lt;powerPointSlideInfo index="1"&gt; &lt;slideId&gt;256&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="2"&gt; &lt;slideId&gt;257&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="3"&gt; &lt;slideId&gt;316&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="4"&gt; &lt;slideId&gt;330&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="5"&gt; &lt;slideId&gt;325&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;/powerPointSlideInfoL ist&gt;</pre>

# REST Framework Services

The API includes support for the following functional groups:

- Session Management
- Asset Management
- Collection Management
- Query Management
- Administration
- Publishing
- Script Execution
- Archive & Restore Management
- Office Document Management
- Charts Management
- Configuration Management
- Clipboard Management

The input parameters for all functions have been identified in their description as being either mandatory or optional. An input value designated with [value], indicates a value that you must provide.

Many functions require an `op` parameter as input. The `op` parameter allows you to specify which operation is to be performed. The value required for the `op` parameter for each function is given.

## Session management

The session management capabilities of the API allow application developers to manage sessions and includes the following REST calls:

- `logOn`
- `getSession`
- `getAllSessions`
- `keepSessionAlive`
- `terminateSession`
- `getMaxIdleTime`

## REST FRAMEWORK SERVICES

- *validatePassword*
- *logOff*

### logOn

<b>Function</b>	Log in		
<b>Description</b>	This request starts a session.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../sessions/[user name]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	logOn		<code>com.quark.qpp.service.facadeClass.SessionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=logon</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>password=[password]</code>	string	Users password (Mandatory).
	<code>asusername=[name]</code>	string	If password is set to the super admin password, you can perform actions as a different user by supplying that user name here. (Optional)
	<code>machinename=[name]</code>	string	Lets you pass the name of the computer from which you have logged in. (Optional) If this value is not provided then the machinename is set as localhost for this session.
	<code>appname=[name]</code>	string	Lets you pass the name of the application from which you have logged in. (Optional) If this value is not provided then the appname is set as Rest Client for this session.
	<b>Returns</b>		
	Returns a <code>sessionInfo</code> object in XML format. See the table in the "Request/Response parameter formats" chapter.		
<b>Examples</b>	<b>URL:</b>		
	<code>http://serverName:serverPort/rest/service/sessions/Admin?op=logon&amp;password=Admin</code>		
	<b>Result:</b>		
	<pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;sessionInfo&gt;     &lt;sessionId&gt;30609864-6dd2-4eba-9031- c80ef56f3a45&lt;/sessionId&gt;     &lt;userId&gt;1&lt;/userId&gt;     &lt;userName&gt;Admin&lt;/userName&gt;     &lt;timeCreated&gt;2013-04-10T07:32:06Z&lt;/timeCreated&gt;     &lt;lastAccessedTime&gt;2013-04-10T07:32:06Z&lt;/lastAccessedTime&gt;     &lt;machineName&gt;localhost&lt;/machineName&gt;     &lt;applicationName&gt;Rest Client&lt;/applicationName&gt;</pre>		

	<pre>&lt;timeZoneOffset&gt;+05:30&lt;/timeZoneOffset&gt; &lt;/sessionInfo&gt;</pre>
--	---

**getSession**

<b>Function</b>	Get information about a specific session	
<b>Description</b>	This request returns information about a specific session.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../sessions/[session ID]</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getSession</code>	<code>com.quark.qpp.service.facade</code> <code>Class SessionFacade</code>
<b>Parameters</b>	This request requires no input parameters	
<b>Returns</b>	Returns a <code>sessionInfo</code> object in XML format. See the table in the “Request/Response parameter formats” chapter.	
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/sessions/30609864-6dd2-4eba-9031-c80ef56f3a45</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;sessionInfo&gt;   &lt;sessionId&gt;30609864-6dd2-4eba-9031-c80ef56f3a45&lt;/sessionId&gt;   &lt;userId&gt;1&lt;/userId&gt;   &lt;userName&gt;Admin&lt;/userName&gt;   &lt;timeCreated&gt;2013-04-10T07:32:06Z&lt;/timeCreated&gt;   &lt;lastAccessedTime&gt;2013-04-10T07:32:06Z&lt;/lastAccessedTime&gt;   &lt;machineName&gt;localhost&lt;/machineName&gt;   &lt;applicationName&gt;Rest Client&lt;/applicationName&gt;   &lt;timeZoneOffset&gt;+05:30&lt;/timeZoneOffset&gt; &lt;/sessionInfo&gt;</pre>	

**getAllSessions**

<b>Function</b>	Get all sessions	
<b>Description</b>	This request returns a list of all the active sessions.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../sessions</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllSessions</code>	<code>com.quark.qpp.service.facade</code> <code>Class SessionFacade</code>
<b>Parameters</b>	This request requires no input parameters	
<b>Returns</b>	Returns a <code>sessionInfoList</code> object containing an array of active sessions in XML format. See the table in the “Request/Response parameter formats” chapter.	
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/sessions</pre>	

	<p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;sessionInfoList&gt;   &lt;sessionInfo&gt;     &lt;sessionId&gt;e1a89f4c-aa30-488d-9e0e-e067e3431be4&lt;/sessionId&gt;     &lt;userId&gt;1&lt;/userId&gt;     &lt;userName&gt;Admin&lt;/userName&gt;     &lt;timeCreated&gt;2013-04-10T06:11:56Z&lt;/timeCreated&gt;     &lt;lastAccessedTime&gt;2013-04-10T13:02:57+05:30&lt;/lastAccessedTime&gt;     &lt;machineName&gt;0:0:0:0:0:1&lt;/machineName&gt;     &lt;applicationName&gt;Quark Publishing Platform Web Client&lt;/applicationName&gt;     &lt;timeZoneOffset&gt;+05:30&lt;/timeZoneOffset&gt;   &lt;/sessionInfo&gt;   ... &lt;/sessionInfoList&gt;</pre>
--	--

### keepSessionAlive

<b>Function</b>	Keep a specific session alive		
<b>Description</b>	This request keeps the current session alive. The maximum idle time for a session is 60 seconds, which can be updated in the {qpp_home}/serverApp.properties file.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../sessions/</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>keepSessionAlive</code>		<code>com.quark.qpp.service.facade.SessionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=keepalive</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation will run only for a valid session id.
<b>Returns</b>	Returns a <code>sessionInfo</code> object in XML format. See the table in the "Request/Response parameter formats" chapter.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/sessions?op=keepalive</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;sessionInfo&gt;   &lt;sessionId&gt;30609864-6dd2-4eba-9031-c80ef56f3a45&lt;/sessionId&gt;   &lt;userId&gt;1&lt;/userId&gt;   &lt;userName&gt;Admin&lt;/userName&gt;   &lt;timeCreated&gt;2013-04-10T07:32:06Z&lt;/timeCreated&gt;   &lt;lastAccessedTime&gt;2013-04-10T07:32:06Z&lt;/lastAccessedTime&gt;   &lt;machineName&gt;localhost&lt;/machineName&gt;   &lt;applicationName&gt;Rest Client&lt;/applicationName&gt;   &lt;timeZoneOffset&gt;+05:30&lt;/timeZoneOffset&gt; &lt;/sessionInfo&gt;</pre>		

**terminateSession**

<b>Function</b>	Delete a session		
<b>Description</b>	This request terminates the session with the given sessionID.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../sessions/[session ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>terminateSession</code>		<code>com.quark.qpp.service.facade</code> <code>Class SessionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation will run only for a valid session id.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/sessions/fee9ea88-68cc-47b9-a576-dab6ad0181eb?op=delete</code>		

**getMaxIdleTime**

<b>Function</b>	Get the maximum idle time for all sessions		
<b>Description</b>	This request returns the value for maximum idle time setting for all sessions in seconds. User can update the value for the <code>session.maxIdle</code> property by editing the ( <code>qpp_home/conf</code> ) <code>serverApp.properties</code> file.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../sessions</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getMaxIdleTime</code>		<code>com.quark.qpp.service.facade</code> <code>Class SessionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=maxidletime</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	Returns the maximum idle time set for sessions (for example, 60 seconds (Default)).		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/sessions?op=maxidletime</code> <b>Result:</b> <code>60</code>		

**validatePassword**

<b>Function</b>	Validate a password		
<b>Description</b>	This request validates a password for a user.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../sessions/[user name]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>validatePassword</code>		<code>com.quark.qpp.service.facade</code> <code>Class SessionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=validate</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>password=[password]</code>	string	Password to be validated. (Mandatory)
<b>Returns</b>	Returns a string value of <code>true</code> or <code>false</code> .		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/sessions/Admin?op=validate&amp;password=Admin</code>		
	<b>Result:</b> <code>True/False</code>		

**logOff**

<b>Function</b>	Log out		
<b>Description</b>	This request ends the session that you are currently logged into.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../sessions/[session ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>logOff</code>		<code>com.quark.qpp.service.facade</code> <code>Class SessionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=logoff</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)This operation will run only for a valid session id.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/sessions/fee9ea88-68cc-47b9-a576-dab6ad0181eb?op=logoff</code>		

## Asset management

The asset management capabilities of the API allow application developers to manage assets and relations and includes the following REST calls:

- *getAsset*
- *getAssetAllVersions*
- *importAsset*
- *importNewAsset*
- *updateAsset*
- *duplicateAsset*
- *deleteAsset*
- *createAssetRelation*
- *createAssetRelations*
- *getAssetRelations*
- *updateAssetRelation*
- *deleteAssetRelation*
- *deleteAssetRelationsForParent*
- *generateTextIndexesOfAllAssets*
- *generateTextIndexes*
- *getAssetVersionNumbers*
- *getAssetRenditionsInfo*
- *getAvailableRenditions*
- *updateChildVersionForAsset*
- *updateChildAssetVersionForRelationId*
- *updateAllChildAssetsVersions*
- *updateChildVersionLockingFlag*
- *checkIn*
- *checkInNew*
- *checkInArticle*
- *checkInNewArticle*
- *checkInRendition*
- *checkOut*
- *abortCheckout*
- *saveDraft*
- *promoteDraft*

## REST FRAMEWORK SERVICES

- *detectContentType*
- *generateTextIndexes*
- *generateTextIndexesOfAllAssets*

➔ If you are retrieving information about a custom relationship that could be renamed, or if you are retrieving system relationship names that have been localized, use the relationship's ID number instead of the name. To get the IDs of all relationships, use a call to `/admin/relationshiptypes`.

### getAsset

<b>Function</b>	Get all metadata for an asset.		
<b>Description</b>	This request returns all of the metadata associated with an asset.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../assetsbypath/[asset path]</code> or <code>/assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAsset</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>attributes=all</code>	string	(Mandatory)
<b>Returns</b>	Returns an <code>assetInfo</code> object with the metadata of all attributes.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/assets/4?attributes=all</code> <b>Result:</b> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="4"&gt;     &lt;assetVersion minorVersion="1" majorVersion="0"/&gt;     &lt;attributeValueList&gt;         &lt;attributeValue type="numeric" name="Id" id="1"&gt;4&lt;/attributeValue&gt;         &lt;attributeValue type="text" name="Name" id="2"&gt;1quark2.jpg&lt;/attributeValue&gt;         ...     &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre>		

<b>Function</b>	Get a specific piece of metadata for an asset.		
<b>Description</b>	This request returns a specific piece of metadata associated with an asset.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../assetsbypath/[asset path]</code> or <code>/assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAsset</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>attributes= [comma-separated list of</code>	string	For a list of attributes, use a call to <code>admin/attributes</code> . (Mandatory)

	attribute names or IDs ]		
	majorversion and minorversion	string	Specify the required major and minor version for which the given rendition of an asset is required. (Optional) These parameters will be used collectively. If neither parameter is passed, the latest version of the asset will be considered. If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
	includechildren	boolean	Returns the relation information of all child assets for the given asset. (Optional)
	includeparents	boolean	Returns the relation information of all parent assets for the given asset. (Optional)
Returns	Returns an <code>assetInfo</code> object with the metadata of specified attributes.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/4?attributes=1,n ame,3,4,5,6,7,8,54,collection</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="4"&gt;   &lt;assetVersion minorVersion="1" majorVersion="0"/&gt;   &lt;attributeValueList&gt;     &lt;attributeValue type="numeric" name="Id" id="1"&gt;4&lt;/attributeValue&gt;     ...   &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre> <p>...with the <code>majorversion</code> and <code>minorversion</code> parameters</p> <p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/292?attributes=1 , name, 3, 4, 5, 6, 7, 8, 54, collection&amp;majorversion=1&amp;minorversion=0</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="292"&gt;   &lt;assetVersion minorVersion="0" majorVersion="1"/&gt;   &lt;attributeValueList&gt;     &lt;attributeValue valueId="0" type="numeric" name="Id" id="1"&gt;292&lt;/attributeValue&gt;     &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;15116462.qxp&lt;/attributeValue&gt;     &lt;attributeValue valueId="0" type="dateTime" name="Created" id="3"&gt;2013-10-16T11:48:52Z&lt;/attributeValue&gt;     &lt;attributeValue valueId="0" type="dateTime" name="Last modified" id="4"&gt;2013-10-16T11:54:56Z&lt;/attributeValue&gt;     &lt;attributeValue valueId="1" type="popup" name="Creator" id="5"&gt;Admin&lt;/attributeValue&gt;     &lt;attributeValue valueId="1" type="popup" name="Last modifier" id="6"&gt;Admin&lt;/attributeValue&gt;</pre>

If this parameter is not passed it is defaulted to 1.</p>	<code>contentDisposition=[option]</code>		Controls whether the response body part displays inline (automatically upon receipt of the message). Defaults to inline. (Optional)
Name	Type	Description														
<code>rendition=highres or rendition=1</code>		<p>Specify the required rendition type. (Optional) If the parameter is not passed the system returns the highres rendition type of the asset.</p> <p>Available renditions types are:</p> <ul style="list-style-type: none"> <li>• HIGHRES</li> <li>• PREVIEW</li> <li>• THUMBNAIL</li> <li>• ARTICLE_PAGE_PICTURE</li> <li>• DECONSTRUCTED_XML</li> <li>• TEXT</li> </ul>														
<code>layout=1</code>		<p>Specify layout ID in case of QuarkXPress document or CopyDesk article. (Optional) Layout only applies to a content type of QuarkPress, QuarkXPress Template , InDesign Document and InDesign Document Template. If this parameter is not passed it is defaulted to 1.</p>														
<code>page=2</code>		<p>Specify page in case of QuarkXPress document or CopyDesk article. (Optional) Page applies to all assets that have multi-page renditions. If this parameter is not passed it is defaulted to 1.</p>														
<code>contentDisposition=[option]</code>		Controls whether the response body part displays inline (automatically upon receipt of the message). Defaults to inline. (Optional)														

	<code>majorversion=[x] and minorversion=[x]</code>	long	Specify the required major and minor version for which the given rendition of an asset is required. (Optional) These parameters will be used collectively. If neither parameter is passed, the latest version of the asset will be considered. If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
<b>Returns</b>	Returns a filestream of required assets based on given parameters.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/assetsbypath/Home/15116.qxp?rendition=preview</code></p> <p><b>Result:</b>  A filestream of a generated preview of the given asset.</p>		

<b>Function</b>	Get relationship with parent asset.		
<b>Description</b>	This request allows you to fetch the information of an asset and its relationship to parent assets.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAsset</code>		<code>com.quark.qpp.service.facade.AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>includeparents=true</code>	boolean	Parameter to fetch metadata of its parent assets. (Mandatory)
	<code>relationtypes=[comma-separated list of relationship names or IDs]</code>	long (relation type id) or string (relation type name)	You can retrieve the list of relationship types with <code>/admin/relationtypes</code> . (Optional)  If not specified, the metadata related to all types of existing relations will be returned.  The available relation types are: <ul style="list-style-type: none"><li>• Primary Attachment</li><li>• Secondary Attachment</li><li>• Article Component Ref Attachment</li><li>• Overlay Attachment</li><li>• XML Component Reference</li><li>• InDesign Behavior Reference</li><li>• InDesign Hyperlink Reference</li></ul>

## REST FRAMEWORK SERVICES

<b>Returns</b>	Returns an <code>assetInfo</code> object containing metadata of the relationship to the parent assets.
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/[asset id]?includeparents=true</pre> <p><b>Result:</b></p> <p>The <code>assetInfo</code> object containing metadata of the relationship to the parent assets.</p>

<b>Function</b>	Get relationship with child assets.		
<b>Description</b>	This request allows you to fetch the information of an asset and its relationship to its child assets.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../assetsbypath/[asset path]</code> or <code>/assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAsset</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>includechildren=true</code>	boolean	<p>Parameter to fetch metadata of its child assets. (Mandatory)</p> <p>You can retrieve the list of relationship types with <code>/admin/relationshiptypes</code>. (Optional)</p> <p>If not specified, the metadata related to all types of existing relations will be returned.</p> <p>The available relation types are:</p> <ul style="list-style-type: none"> <li>• Primary Attachment</li> <li>• Secondary Attachment</li> <li>• Article Component Ref Attachment</li> <li>• Overlay Attachment</li> <li>• XML Component Reference</li> <li>• InDesign Behavior Reference</li> <li>• InDesign Hyperlink Reference</li> </ul>
<b>Returns</b>	Returns an <code>assetRelationInfoList</code> object containing metadata of relations to parent and child assets. See the table in the “Request/Response parameter formats” chapter.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/[asset id]?includechildren=true</pre>		

	<b>Result:</b> The <code>assetInfo</code> object containing metadata of the relationship to child assets.
--	--

<b>Function</b>	Get relationship with parent and child assets.		
<b>Description</b>	This request allows you to retrieve an assets information and information about its relationship to parent and child assets.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../assetsbypath/[asset path]</code> or <code>/assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAsset</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>includeparents=true&amp;includechildren=true</code>	boolean	Specify if the relation metadata to parent assets or child assets is to be included or not. (Mandatory)
<b>Returns</b>	Returns an <code>assetRelationInfoList</code> object containing metadata of relations to parent and child assets. See the table in the "Request/Response parameter formats" chapter.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/assets/[assetid]?includ</code>  <code>echildren=true&amp;includeparents=true</code></p> <p><b>Result:</b></p> <p>The <code>assetInfo</code> object containing metadata of relations to parent and child assets.</p>		

<b>Function</b>	Get a Draft copy of an asset.		
<b>Description</b>	This request returns a draft version of the required asset. If the draft doesn't exists, the last saved version of the asset will be returned.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../assetsbypath/[asset path]</code> or <code>/assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAsset</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>attributes= [comma-separated list of attribute names or IDs]</code>	string	For a list of attributes, use a call to <code>admin/attributes</code> . (Mandatory)
<b>Returns</b>	Returns an <code>assetInfo</code> object with the metadata of all attributes.		
	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/assets/4?attributes=all</code>  <code>&amp;draft=true</code></p>		

	<p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="4"&gt;     &lt;assetVersion minorVersion="1" majorVersion="0"/&gt;     &lt;attributeValueList&gt;         &lt;attributeValue type="numeric" name="Id" "Id="1"&gt;4&lt;/attributeValue&gt;         &lt;attributeValue type="text" name="Name" id="2"&gt;1quark2.jpg&lt;/attributeValue&gt;         ....     &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre>
--	--

**getAssetAllVersions**

<b>Function</b>	Get all attributes for all versions of an asset.		
<b>Description</b>	This request returns all attributes for all versions of an asset.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAssetAllVersions</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=allversions</code>	string	This operation will list all the metadata of all the versions. (Mandatory)
<b>Returns</b>	Returns an <code>assetInfoList</code> object containing an array of all versions of the same asset with all of its' metadata. See the table in the "Request/Response parameter formats" chapter.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/assets/4?op=allversions</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfoList&gt;     &lt;assetInfo id="4" assetVersion minorVersion="1" majorVersion="0"/&gt;     &lt;attributeValueList&gt;         &lt;attributeValue type="numeric" name="Id" id="1"&gt;4&lt;/attributeValue&gt;         ....     &lt;/attributeValueList&gt; &lt;/assetInfo&gt;     &lt;assetInfo id="4" assetVersion minorVersion="2" majorVersion="0"/&gt;     &lt;attributeValueList&gt;         &lt;attributeValue type="numeric" name="Id" id="1"&gt;4&lt;/attributeValue&gt;         ....     &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>		

**importAsset**

<b>Function</b>	Import a new version of an existing asset.		
<b>Description</b>	This request imports the new version of an asset.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>importAsset</code>		<code>com.quark.qpp.service.facade Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=import</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)  This request will insert an asset into the system without giving its stream.
	<code>attributevalues=&lt;xml/&gt;</code>	string	The set of attribute values.  See "Request/Response parameter formats."(Mandatory)
	<code>createminorversion=[true false]</code>	boolean	Defaults to <code>false</code> .(Optional)
	<code>index=[true false]</code>	boolean	Defaults to <code>true</code> .(Optional)
<b>Returns</b>	Returns an <code>assetInfo</code> object in XML format.		
<b>Examples</b>	<b>URL:</b>  <code>http://serverName:serverPort/rest/service/[asset name]?op=import</code> <code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;</code> <code>  &lt;assetInfo id="4"&gt;</code> <code>    &lt;assetVersion minorVersion="1" majorVersion="0"/&gt;</code> <code>    &lt;attributeValueList&gt;</code> <code>      &lt;attributeValue type="numeric" name="Id" id="1"&gt;4&lt;/attributeValue&gt;</code> <code>      &lt;attributeValue type="text" name="Name" id="2"&gt;1quark2.jpg&lt;/attributeValue&gt;</code> <code>      ....</code> <code>    &lt;/attributeValueList&gt;</code> <code>  &lt;/assetInfo&gt;</code>  <b>Result:</b>		
	The <code>assetInfo</code> object in XML format.		

## REST FRAMEWORK SERVICES

### importNewAsset

<b>Function</b>	Import a new asset		
<b>Description</b>	This request imports a new asset.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assetsbypath/[asset path] or /assets/[asset name]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>importNewAsset</code>		<code>com.quark.qpp.service.facade Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=importnew</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)  This request will insert an asset into the system without giving its stream.
	<code>attributevalues=&lt;xml/&gt;</code>	string	The set of attribute values.  See “Request/Response parameter formats.” (Mandatory)
	<code>index=[true false]</code>	boolean	Defaults to <code>true</code> . (Optional)
<b>Returns</b>	Returns an <code>assetInfo</code> object in XML format.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/[asset name]?op=importnew</pre> <p>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;</p> <pre>&lt;assetInfo id="4"&gt;   &lt;assetVersion minorVersion="1" majorVersion="0"/&gt;   &lt;attributeValueList&gt;     &lt;attributeValue type="numeric" name="Id"       id="1"&gt;4&lt;/attributeValue&gt;     &lt;attributeValue type="text" name="Name"       id="2"&gt;1quark2.jpg&lt;/attributeValue&gt;     ....   &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre> <p><b>Result:</b></p> <p>The <code>assetInfo</code> object in XML format.</p>		

### updateAsset

<b>Function</b>	Update repository attributes.
-----------------	-------------------------------

<b>Description</b>	This requests updates the attribute values that are owned by a given repository adaptor.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assets/[asset id]?op=update&amp;repotoken=[repo token]&amp;attributes=....</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateAsset</code>		<code>com.quark.qpp.service.facade Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributes=&lt;xml /&gt;</code>	string	The set of attribute values. See "Request/Response parameter formats."(Mandatory)
	<code>repotoken=[token]</code>	GUID	The repository token provided to the repository adaptor during repository adaptor registration. (Mandatory)
	<code>majorversion=[x] and minorversion=[x]</code>	long	<p>Specify the required major and minor version for which the given rendition of an asset is required. (Optional)</p> <p>These parameters will be used collectively.</p> <p>If neither parameter is passed, the latest version of the asset will be considered.</p> <p>If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.</p>
<b>Returns</b>	Returns an <code>assetInfo</code> object in XML format.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/24?op=update&amp; attributevalues= &lt;attributeValueList&gt; &lt;attributeValue name="name"&gt;blag_new&lt;/attributeValue&gt; &lt;attributeValue name="status"&gt;Status2&lt;/attributeValue&gt; &lt;attributeValue name="workflow"&gt;Workflow2&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &amp;repotoken=[repository token]</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="4"&gt;   &lt;assetVersion minorVersion="1" majorVersion="0"/&gt;   &lt;attributeValueList&gt;     &lt;attributeValue type="numeric" name="Id" id="1"&gt;4&lt;/attributeValue&gt;     &lt;attributeValue type="text" name="Name" id="2"&gt;1quark2.jpg&lt;/attributeValue&gt;     ...   &lt;/attributeValueList&gt;</pre>		

## REST FRAMEWORK SERVICES

	</assetInfo>
--	--------------

<b>Function</b>	Update an asset's attributes.		
<b>Description</b>	This request allows you to update attributes of specific version of an asset.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>/assetsbypath/[asset path] or /assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateAsset</code>		<code>com.quark.qpp.service.facade Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributevalues=&lt;xml/&gt;</code>	string	The set of attribute values. See "Request/Response parameter formats."(Mandatory)
<b>Returns</b>	Return an <code>assetInfo</code> object of the specified asset with updated metadata.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/[parent asset id]?op=update&amp;attributevalues= &lt;attributeValueList&gt;   &lt;attributeValue name="name"&gt;blag_new&lt;/attributeValue&gt;   &lt;attributeValue name="status"&gt;Status2&lt;/attributeValue&gt;   &lt;attributeValue name="workflow"&gt;Workflow2&lt;/attributeValue&gt; &lt;/attributeValueList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="4"&gt;   &lt;assetVersion minorVersion="1" majorVersion="0"/&gt; &lt;attributeValueList&gt;   &lt;attributeValue type="numeric" name="Id" id="1"&gt;4&lt;/attributeValue&gt;   &lt;attributeValue type="text" name="Name" id="2"&gt;1quark2.jpg&lt;/attributeValue&gt;   ... &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre>		

### duplicateAsset

<b>Function</b>	Duplicate an asset	
<b>Description</b>	This request creates a duplicate of an asset.	
<b>Type</b>	POST	
<b>URL Format</b>	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>duplicateAsset</code>	<code>com.quark.qpp.service.facade Class AssetFacade</code>

	Name	Type	Description
Parameters	op=duplicate	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	attributevalues=<xml/>	string	The set of attribute values. See “Request/Response parameter formats.” The following attributes are Mandatory: <ul style="list-style-type: none"><li>• NAME</li><li>• COLLECTION</li></ul> (There is a choice between collection <b>ID</b> , <b>Name</b> and <b>Path</b> when providing a value for the <b>Collection</b> attribute).
	createminorversion =[true false]	boolean	specify if the duplicated asset is to be created as a Major or Minor Version. Defaults to <b>false</b> . (Optional)
	relationtypes =[comma-separated list of relationship names or IDs]	string or long	You can retrieve the list of relationship types with <a href="#">/admin/relationtypes</a> . (Optional)
Returns	Returns an <code>assetInfo</code> object of the newly created asset in XML format.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/4?op=duplicate&amp;attributevalues=&lt;attributeValueList&gt;&lt;attributeValue name="name"&gt;Duplicate_asset&lt;/attributeValue&gt;&lt;attributeValue name="collection"&gt;1&lt;/attributeValue&gt;&lt;/attributeValueList&gt;&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;&lt;assetInfo id="11"&gt;&lt;assetVersion minorVersion="0" majorVersion="1"/&gt;&lt;attributeValueList&gt;&lt;attributeValue type="numeric" name="Id" id="1"&gt;11&lt;/attributeValue&gt;&lt;attributeValue type="text" name="Name" id="2"&gt;Duplicate_asset&lt;/attributeValue&gt;....&lt;/attributeValueList&gt;&lt;/assetInfo&gt;</pre> <p><b>Result:</b></p> <p>The <code>assetInfo</code> object of the newly created asset in XML format.</p>		

## deleteAsset

Function	Delete an asset.
Description	This request deletes a specified asset from the QPP server.

## REST FRAMEWORK SERVICES

Type	POST		
URL Format	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>		
Java API	Method Name		Class Name
	<code>deleteAsset</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
Parameters	Name	Type	Description
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)  This request will lock the asset internally and delete it from system.
	<code>majorversion=[x] and minorversion=[x]</code>	long	Specify the required major and minor version for which the given rendition of an asset is required. (Optional)  These parameters will be used collectively.  If neither parameter is passed, the latest version of the asset will be considered.  If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
	<code>deleteminorver=True/False</code>	boolean	Indicates if all minor versions of the given asset version are to be deleted or not.  If <code>True</code> - all minor versions (associated with the given major version) of the asset would also be deleted.  If <code>False</code> , only the specified version will be deleted. This parameter would be considered only when the given asset version is major. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p>URL:  <code>http://serverName:serverPort/rest/service/assets/25?op=delete</code></p>		

### createAssetRelation

Function	Create a relationship between two assets.	
Description	This request creates a relationship between two assets.	
Type	POST	
URL Format	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>	
Java API	Method Name	Class Name
	<code>createAssetRelation</code>	<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>

	Name	Type	Description
Parameters	<code>op=createrelation</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)  This operation requires parent asset to be in a Checked-Out state.
	<code>childassetid=[asset id]</code>	long	The ID of the other asset in the relationship. (Mandatory)
	<code>relationtype=[x]</code>	long	1 = primary attachment, 2 = secondary attachment. (Mandatory)  The available relation types are: <ul style="list-style-type: none"><li>• Primary Attachment</li><li>• Secondary Attachment</li><li>• Article Component Ref Attachment</li><li>• Overlay Attachment</li><li>• XML Component Reference</li><li>• InDesign Behavior Reference</li><li>• InDesign Hyperlink Reference</li></ul>
	<code>attributevalues=&lt;xml/&gt;</code>	string	The set of attribute values.  See "Request/Response parameter formats."  For <b>Secondary Attachment</b> and <b>Overlay Attachment</b> the following attributes are Mandatory: <ul style="list-style-type: none"><li>• ATTACHED_LAYOUT_ID</li><li>• BOX_ID</li><li>• PAGE_NAME</li><li>• PAGE_INDEX</li></ul> For <b>Primary Attachment</b> the following attribute is also Mandatory in addition to the above mentioned four attributes: <ul style="list-style-type: none"><li>• ATTACHED_COMPONENT_ID</li></ul> For <b>ArticleComponentRef Attachment</b> the following two attributes are also Mandatory in addition to the above mentioned four attributes: <ul style="list-style-type: none"><li>• ARTICLE_ID</li><li>• ARTICLE_COMPONENT_ID</li></ul>
	<code>childmajorversion=[x]</code>	long	Specify the required childmajor and

	<p>and  <code>childminorversion=[x]</code></p>		<p>childminor version for which the given rendition of an asset is required.          (Optional)</p> <p>These parameters will be used collectively.</p> <p>If neither parameter is passed, the latest version of the asset will be considered.</p> <p>If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.</p>
	<code>lockedtochildversion=[true false]</code>	<b>boolean</b>	Defaults to false. Allows you to pin relationships to a particular version if true. (Optional)
<b>Returns</b>	Returns an <code>assetRelationInfo</code> object containing metadata of the relation, parent and child asset. See the table in the “Request/Response parameter formats” chapter.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/[parent asset Id]?op=createrelation &amp;childassetid=[child asset Id]&amp;relationtype=Secondary Attachment&amp;attributevalues=&lt;attributeValueList&gt; &lt;attributeValue id="401"&gt;1&lt;/attributeValue&gt; &lt;attributeValue id="402"&gt;5&lt;/attributeValue&gt; &lt;attributeValue id="403"&gt;1&lt;/attributeValue&gt; &lt;attributeValue id="404"&gt;1&lt;/attributeValue&gt; &lt;attributeValue id="412"&gt;1&lt;/attributeValue&gt; &lt;/attributeValueList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetRelationInfo     relationStateId="3"     relationState="Related Temporarily"     relationTypeId="2"     relationType="Secondary Attachment"     childAssetMinorVersion="2"     childAssetMajorVersion="0"     childAssetName="1quark2.jpg"     childAssetId="4"     parentAssetName="15116.qxp"     parentAssetId="5"     id="13"&gt;     &lt;attributeValueList&gt;         &lt;attributeValue type="numeric" name="Attached Layout Uid" id="401"&gt;1&lt;/attributeValue&gt;         &lt;attributeValue type="numeric" name="Box Uid" id="402"&gt;5&lt;/attributeValue&gt;         &lt;attributeValue type="text" name="Page Name" id="403"&gt;1&lt;/attributeValue&gt;         &lt;attributeValue type="numeric" name="Page Index" id="404"&gt;1&lt;/attributeValue&gt;         &lt;attributeValue type="numeric" name="Attached Component Id" id="412"&gt;1&lt;/attributeValue&gt;     &lt;/attributeValueList&gt; &lt;/assetRelationInfo&gt;</pre>		

**createAssetRelations**

<b>Function</b>	Create several relationships between an asset and other assets at one time.		
<b>Description</b>	This request creates several relationships between an asset and other assets in a single request.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assetsbypath</code> or <code>/assets</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createAssetRelations</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=createrelations</code>	string	<p>The <code>op</code> parameter allows you to specify which operation is to be performed. (Mandatory)</p> <p>This request requires that the parent asset to be in checked-out state.</p>
	<code>relations=&lt;xml/&gt;</code>		<p>See “Request/Response parameter formats.” (Mandatory)</p> <p>The <code>relationInfoList</code> returned will contain the metadata of all the relations that have to be created.</p> <p>The following is an example of creating several relationships at one time:</p> <p><b>Overlay Attachment:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;assetRelationInfoList&gt; &lt;assetRelationInfo id="112" parentAssetId="306" parentAssetName="15116d33.qxp" childAssetId="307" childAssetName="Picture2503.jpg" childAssetMinorVersion="1" relationType="Overlay Attachment" relationTypeId="3" relationState="Related Temporarily" relationStateId="3"&gt; &lt;attributeValueList&gt; &lt;attributeValue id="401" name="Attached Layout Uid" type="numeric"&gt;1&lt;/attributeValue&gt; &lt;attributeValue id="402" name="Box Uid" type="numeric"&gt;17&lt;/attributeValue&gt; &lt;attributeValue id="403" name="Page Name" type="text"&gt;Page 1&lt;/attributeValue&gt; &lt;attributeValue id="404" name="Page Index" type="numeric"&gt;0&lt;/attributeValue&gt; </pre>

## REST FRAMEWORK SERVICES

			<pre>ue&gt; &lt;/attributeValueList&gt; &lt;/assetRelationInfo&gt; &lt;assetRelationInfo id="113" parentAssetId="306" parentAssetName="15116d33.qxp" childAssetId="308" childAssetName="Picture2aba.jpg" childAssetMinorVersion="1" relationType="Overlay Attachment" relationTypeId="3" relationState="Related Temporarily" relationStateId="3"&gt; &lt;attributeValueList&gt; &lt;attributeValue id="401" name="Attached Layout Uid" type="numeric"&gt;1&lt;/attributeVal ue&gt; &lt;attributeValue id="402" name="Box Uid" type="numeric"&gt;17&lt;/attributeVa lue&gt; &lt;attributeValue id="403" name="Page Name" type="text"&gt;Page 1&lt;/attributeValue&gt; &lt;attributeValue id="404" name="Page Index" type="numeric"&gt;0&lt;/attributeVal ue&gt; &lt;/attributeValueList&gt; &lt;/assetRelationInfo&gt; &lt;assetRelationInfo id="114" parentAssetId="306" parentAssetName="15116d33.qxp" childAssetId="309" childAssetName="Picture2810.jpg" childAssetMinorVersion="1" relationType="Overlay Attachment" relationTypeId="3" relationState="Related Temporarily" relationStateId="3"&gt; &lt;attributeValueList&gt; &lt;attributeValue id="401" name="Attached Layout Uid" type="numeric"&gt;1&lt;/attributeVal ue&gt; &lt;attributeValue id="402" name="Box Uid" type="numeric"&gt;17&lt;/attributeVa lue&gt; &lt;attributeValue id="403" name="Page Name" type="text"&gt;Page 1&lt;/attributeValue&gt; &lt;attributeValue id="404" name="Page Index" type="numeric"&gt;0&lt;/attributeVal ue&gt; &lt;/attributeValueList&gt; &lt;/assetRelationInfo&gt; &lt;assetRelationInfo id="115" parentAssetId="306" parentAssetName="15116d33.qxp" childAssetId="310" childAssetName="Picture225d.jpg" childAssetMinorVersion="1" relationType="Overlay Attachment" relationTypeId="3" relationState="Related</pre>

			<pre> Temporarily" relationStateId="3"&gt; &lt;attributeValueList&gt; &lt;attributeValue id="401" name="Attached Layout Uid" type="numeric"&gt;1&lt;/attributeVal ue&gt; &lt;attributeValue id="402" name="Box Uid" type="numeric"&gt;17&lt;/attributeVa lue&gt; &lt;attributeValue id="403" name="Page Name" type="text"&gt;Page 1&lt;/attributeValue&gt; &lt;attributeValue id="404" name="Page Index" type="numeric"&gt;0&lt;/attributeVal ue&gt; &lt;/attributeValueList&gt; &lt;/assetRelationInfo&gt; &lt;assetRelationInfo id="116" parentAssetId="306" parentAssetName="15116d33.qxp" childAssetId="311" childAssetName="Picture24da.jp g" childAssetMinorVersion="1" relationType="Overlay Attachment" relationTypeId="3" relationState="Related Temporarily" relationStateId="3"&gt; &lt;attributeValueList&gt; &lt;attributeValue id="401" name="Attached Layout Uid" type="numeric"&gt;1&lt;/attributeVal ue&gt; &lt;attributeValue id="402" name="Box Uid" type="numeric"&gt;17&lt;/attributeVa lue&gt; &lt;attributeValue id="403" name="Page Name" type="text"&gt;Page 1&lt;/attributeValue&gt; &lt;attributeValue id="404" name="Page Index" type="numeric"&gt;0&lt;/attributeVal ue&gt; &lt;/attributeValueList&gt; &lt;/assetRelationInfo&gt; &lt;/assetRelationInfoList&gt; </pre> <p><b>Primary Attachment:</b></p> <pre> &lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;assetRelationInfoList&gt; &lt;assetRelationInfo parentAssetId="304" childAssetId="305" relationType="Primary Attachment"&gt; &lt;attributeValueList&gt; &lt;attributeValue id="401"&gt;1&lt;/attributeValue&gt; &lt;attributeValue id="402"&gt;5&lt;/attributeValue&gt; &lt;attributeValue id="403"&gt;Page 1&lt;/attributeValue&gt; &lt;attributeValue id="404"&gt;0&lt;/attributeValue&gt; </pre>
--	--	--	--

			<pre>&lt;attributeValue id="412"&gt;145&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetRelationInfo&gt; &lt;/assetRelationInfoList&gt;</pre>
Returns	Returns an <code>assetRelationInfo</code> object containing metadata of the relation, parent and child asset. See the table in the “RequestResponse parameter formats” chapter.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/[parent asset id]?op=createrelations</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetRelationInfoList&gt;     &lt;assetRelationInfo relationStateId="3"         relationState="Related Temporarily"         relationTypeId="2"         relationType="Secondary Attachment"         childAssetMinorVersion="2"         childAssetMajorVersion="0"         childAssetName="1quark2.jpg"         childAssetId="4"         parentAssetName="15116.qxp"         parentAssetId="24"         id="14"&gt;         &lt;attributeValueList&gt;             &lt;attributeValue type="numeric" name="Attached Layout Uid" id="401"&gt;1&lt;/attributeValue&gt;             &lt;attributeValue type="numeric" name="Box Uid" id="402"&gt;5&lt;/attributeValue&gt;             &lt;attributeValue type="text" name="Page Name" id="403"&gt;1&lt;/attributeValue&gt;             &lt;attributeValue type="numeric" name="Page Index" id="404"&gt;1&lt;/attributeValue&gt;             &lt;attributeValue type="numeric" name="Attached Component Id" id="412"&gt;1&lt;/attributeValue&gt;         &lt;/attributeValueList&gt;     &lt;/assetRelationInfo&gt; &lt;/assetRelationInfoList&gt;</pre>		

## getAssetRelations

Function	Get metadata of the relations between two assets	
Description	This request returns information about the relations between two assets.	
Type	GET	
URL Format	<code>.../assetsbypath/relations/[RelationId]</code> or <code>/assets/relations/[RelationId]</code>	
Java API	Method Name	Class Name
	<code>getAssetRelations</code>	<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
Parameters	This request requires no input parameters.	
Returns		

<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/relations/1</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetRelationInfo     relationStateId="1"     relationState="Permanent"     relationTypeId="1"     relationType="Primary Attachment"     childAssetMinorVersion="1"     childAssetMajorVersion="0"     childAssetName="15348eb3.qcd"     childAssetId="51"     parentAssetName="15116bb0.qxp"     parentAssetId="50" id="1"&gt;     &lt;attributeValueList&gt;         &lt;attributeValue valueId="0" type="numeric" name="Attached Layout Uid" id="401"&gt;1&lt;/attributeValue&gt;         &lt;attributeValue valueId="0" type="numeric" name="Box Uid" id="402"&gt;5&lt;/attributeValue&gt;         &lt;attributeValue valueId="0" type="text" name="Page Name" id="403"&gt;Page 1&lt;/attributeValue&gt;         &lt;attributeValue valueId="0" type="numeric" name="Page Index" id="404"&gt;0&lt;/attributeValue&gt;         &lt;attributeValue valueId="0" type="numeric" name="Attached Component Id" id="412"&gt;10&lt;/attributeValue&gt;     &lt;/attributeValueList&gt; &lt;/assetRelationInfo&gt;</pre>
-----------------	---

## updateAssetRelation

<b>Function</b>	Update the relation type and attributes of a relationship.			
<b>Description</b>	This request updates an asset relation with the given Id. In order to update the relation type, specify <code>newRelationType</code> and the corresponding attributes to be set. If the relation type is not supplied then it will update only the relation attributes for the current relation type of the given relation.			
<b>Type</b>	POST			
<b>URL Format</b>	<code>.../assets/relations/[relation ID]</code>			
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>	
	<code>updateAssetRelation</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>	
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)  This request requires that the parent asset is in a checked-out state.	
	<code>relationtype=[relation type name or ID]</code>	long (relation type id) or string	The new relation type. (Mandatory)	

		(relation type name)	
	attributevalues=<xml />	string	<p>The set of relation attribute values.</p> <p>See “Request/Response parameter formats.”</p> <p>For <b>Secondary Attachment</b> and <b>Overlay Attachment</b> the following attributes are Mandatory:</p> <ul style="list-style-type: none"> <li>• ATTACHED_LAYOUT_ID</li> <li>• BOX_ID</li> <li>• PAGE_NAME</li> <li>• PAGE_INDEX</li> </ul> <p>For <b>Primary Attachment</b> the following attribute is also Mandatory ins addition to the above mentioned four attributes:</p> <p>ATTACHED_COMPONENT_ID</p> <p>For <b>ArticleComponent Ref Attachment</b> the following two attributes are also Mandatory ins addition to the above mentioned four attributes:</p> <ul style="list-style-type: none"> <li>• ARTICLE_ID</li> <li>• ARTICLE_COMPONENT_ID</li> </ul>
Returns	Returns an <code>assetRelationInfo</code> object in XML format with an updated set of attributes. See the table in the “Request/Response parameter formats” chapter.		
Examples	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/relations/[relation id]?op=update</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetRelationInfo relationStateId="3"     relationState="Related Temporarily"     relationTypeId="2"     relationType="Secondary Attachment"     childAssetMinorVersion="2"     childAssetMajorVersion="0"     childAssetName="1quark2.jpg"     childAssetId="4"     parentAssetName="15116.qxp"     parentAssetId="5" id="13"&gt;     &lt;attributeValueList&gt;         &lt;attributeValue type="numeric" name="Attached Layout         Uid" id="401"&gt;1&lt;/attributeValue&gt;         &lt;attributeValue type="numeric" name="Box Uid"         id="402"&gt;5&lt;/attributeValue&gt;         &lt;attributeValue type="text" name="Page Name"&gt;</pre>		

	<pre>     id="403"&gt;1&lt;/attributeValue&gt;       &lt;attributeValue type="numeric" name="Page Index"     id="404"&gt;1&lt;/attributeValue&gt;       &lt;attributeValue type="numeric" name="Attached Component     Id" id="412"&gt;1&lt;/attributeValue&gt;     &lt;/attributeValueList&gt;   &lt;/assetRelationInfo&gt;</pre>
--	--

### deleteAssetRelations

<b>Function</b>	Delete a relationship by its id.		
<b>Description</b>	This request deletes a specific relationship between two assets.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assets/relations/[relation ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	deleteAssetRelations		com.quark.qpp.service.facade Class AssetFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	string	<p>The op parameter allows you to specify which operation is to be performed. (Mandatory)</p> <p>This request requires that the parent asset is in a checked-out state.</p>
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/assets/relations/[relation id]?op=delete</code>		

### deleteAssetRelationsForParent

<b>Function</b>	Delete an asset's relationship.		
<b>Description</b>	This request removes all child relations of a specified asset.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	deleteAssetRelationsForParent		com.quark.qpp.service.facade Class AssetFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=deleterelations</code>	string	<p>The op parameter allows you to specify which operation is to be performed. (Mandatory)</p> <p>This request requires that the parent asset is in a checked-out state.</p>
	<code>childassetid=[x]</code>	long	The ID of the child asset in the

## REST FRAMEWORK SERVICES

		relationship to be deleted. (Optional)  If this parameter is not supplied, all the asset's relation to its child assets will be deleted.
Returns	A status of 200 is returned in response to a successful request execution.	
Examples	<b>URL:</b> <code>http://serverName:serverPort/rest/service/assets/27?op=deleterelations</code>	

### generateTextIndexesOfAllAssets

<b>Function</b>	Generate text indexes for all assets.		
<b>Description</b>	This request asynchronously initiates text indexes for all Platform Server assets, including asset attributes and content.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assets/</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>generateTextIndexesOfAllAssets</code>		<code>com.quark.qpp.service.facade</code> Class AssetFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=generatetextindexes</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	A status of 200 is returned in response to a successful request execution, along with the following message: <b>The text indexes generation process has been initiated successfully.</b>		
Examples	<b>URL:</b> <code>http://serverName:serverPort/rest/service/assets?op=generatetextindexes</code>		

### generateTextIndexes

<b>Function</b>	Generate text indexes for a specified asset.		
<b>Description</b>	This request initiates text indexes for a specified asset in Platform Server, including asset attributes and content.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assets/ [asset id]?op=generatetextindexes...</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>generateTextIndexes</code>		<code>com.quark.qpp.service.facade</code> Class AssetFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=generatetextindexes</code>	string	The op parameter allows you to specify

	s		which operation is to be performed. (Mandatory)
	assetid=[asset Id]	long	The ID of the asset. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p>URL:</p> <pre>http://serverName:serverPort/rest/service/assets/&lt;assetId&gt;?op=generateTextIndexes</pre>		

**getAssetVersionNumbers**

Function	Get a list of all versions of an asset.		
Description	This request returns a list of versions for an asset.		
Type	GET		
URL Format	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>		
Java API	Method Name		Class Name
	<code>getAssetVersionNumbers</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
Parameters	Name	Type	Description
	<code>op=listversions</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	Returns an <code>assetVersionList</code> object containing an array of all versions of the same asset.		
Examples	<p>URL:</p> <pre>http://serverName:serverPort/rest/service/assets/4?op=listversions</pre> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetVersionList&gt;     &lt;assetVersion minorVersion="1" majorVersion="0"/&gt;     &lt;assetVersion minorVersion="2" majorVersion="0"/&gt; &lt;/assetVersionList&gt;</pre>		

**getAssetRenditionsInfo**

Function	Get information about an asset's renditions.		
Description	This request returns all information about an asset's renditions.		
Type	GET		
URL Format	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>		
Java API	Method Name		Class Name
	<code>getAssetRenditionsInfo</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
Parameters	Name	Type	Description

## REST FRAMEWORK SERVICES

	<code>op=renditioninfo</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>rendition=preview or rendition=2</code>	string	By specifying rendition type, metadata of that rendition will be returned. (Optional)  Available renditions are: <ul style="list-style-type: none"><li>• PREVIEW</li><li>• THUMBNAIL</li><li>• ARTICLE_PAGE_PICTURE</li><li>• DECONSTRUCTED_XML</li><li>• TEXT</li></ul>
	<code>majorversion=[x] and minorversion=[x]</code>	string	Specify the required major and minor version for which the given rendition of an asset is required. (Optional)  These parameters will be used collectively.  If neither parameter is passed, the latest version of the asset will be considered.  If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
Returns	Returns an <code>assetRenditionInfoList</code> object containing an array of all available renditions of the same asset.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/assets/4?op=renditioninfo</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetRenditionInfoList&gt;     &lt;assetRenditionInfo fileSize="80357" fileExtension="jpg"         filePath="/00/04/4.0-2.2.1.jpg" repositoryId="1"         pageNumber="1" layoutNumber="1" renditionTypeId="2"         renditionType="PREVIEW" minorVersion="2" majorVersion="0"         assetId="4"/&gt;     &lt;assetRenditionInfo fileSize="47142" fileExtension="jpg"         filePath="/00/04/4.0-2.3.1.jpg" repositoryId="1"         pageNumber="1" layoutNumber="1" renditionTypeId="3"         renditionType="THUMBNAIL" minorVersion="2" majorVersion="0"         assetId="4"/&gt; &lt;/assetRenditionInfoList&gt;</pre>		

### getAvailableRenditions

Function	Get a list of an asset's available rendition types
Description	This request returns a list of all the rendition types that are applicable to a specified asset.

Type	GET		
URL Format	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>		
Java API	Method Name		Class Name
	<code>getAvailableRenditions</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
Parameters	Name	Type	Description
	<code>op=listrenditiontypes</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>majorversion=[x] and minorversion=[x]</code>	string	Specify the required major and minor version for which the given rendition of an asset is required. (Optional) These parameters will be used collectively. If neither parameter is passed, the latest version of the asset will be considered. If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
Returns	Returns a <code>namedList</code> object containing an array of all renditions for the specified asset.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/assets/4?op=listrenditiontypes</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;nameIdList&gt;     &lt;nameId id="2" name="PREVIEW"/&gt;     &lt;nameId id="3" name="THUMBNAIL"/&gt; &lt;/nameIdList&gt;</pre>		

### updateChildVersionForAsset

Function	Update the version number of an asset's child asset.		
Description	This request allows you to update the version number of an asset's child asset. The parent asset must be in a checked out state.		
Type	POST		
URL Format	<code>.../assetsbypath/[parent asset path] or /assets/[parent asset ID]</code>		
Java API	Method Name		Class Name
	<code>updateChildVersionForAsset</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
Parameters	Name	Type	Description
	<code>op=updatechildversion</code>	string	The op parameter allows you to specify which operation is to be performed.

			(Mandatory)This operation requires parent asset to be in a Checked-Out state.
	<code>childassetid=[asset ID]</code>	long	The ID of the child asset. (Mandatory)
	<code>majorversion=[x] and minorversion=[x]</code>	long	<p>Specify the required major and minor version for which the given rendition of an asset is required. (Optional)</p> <p>These parameters will be used collectively.</p> <p>If neither parameter is passed, the latest version of the asset will be considered.</p> <p>If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.</p>
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/[parent asset id]?op=updatechildversion&amp;childassetid=4</pre>		

### updateChildAssetVersionForRelationId

<b>Function</b>	Update the version number of a relationship's child asset.		
<b>Description</b>	This request updates a child asset to a given asset version for the given asset relation.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assets/relations/[relation ID]</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>updateChildAssetVersionForRelationId</code>	com.quark.qpp.service.facade Class AssetFacade	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=updatechildversion</code>	string	<p>The op parameter allows you to specify which operation is to be performed. (Mandatory)</p> <p>This operation requires the parent asset to be in a checked-out state.</p>
	<code>majorversion=[x] and minorversion=[x]</code>	string	<p>Specify the required major and minor version for which the given rendition of an asset is required. (Optional)</p> <p>These parameters will be used collectively.</p> <p>If neither parameter is passed, the latest version of the asset will be considered.</p> <p>If only one of the parameters is not passed, then the value for that parameter</p>

			is assumed to be 0.
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p>URL:  <code>http://serverName:serverPort/rest/service/assets/relations/[relation id]?op=updatechildversion</code></p>		

**updateAllChildAssetsVersion**

Function	Update the version number of all of an asset's child assets to the parent asset's current version.		
Description	This request allows you to update the asset versions of all the children of an asset at one time. the parent asset must be in a checked out state.		
Type	POST		
URL Format	<code>.../assetsbypath/[parent asset path]</code> or <code>/assets/[parent asset ID]</code>		
Java API	Method Name		Class Name
	updateAllChildAssetsVersion		com.quark.qpp.service.facade Class AssetFacade
Parameters	Name	Type	Description
	<code>op=updateallchildversion</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>relationtype=[x]</code>	long (relation type id) or string (relation type name)	You can retrieve the list of relationship types with <code>/admin/relationshiptypes</code> . (Optional)  If the relation types are not specified, then the child asset version will be updated in all the relations with the given parent asset id.
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p>URL:  <code>http://serverName:serverPort/rest/service/assets/[parent asset id]?op=updateallchildversion</code></p>		

**updateChildVersionLockingFlag**

Function	Update the “locked” flag for a child asset in a relationship.		
Description	This request updates the lockedToChildVersion flag of the given Asset relation.		
Type	POST		
URL Format	<code>.../assets/relations/[relation ID]</code>		
Java API	Method Name		Class Name
	updateChildVersionLockingFlag		com.quark.qpp.service.facade Class AssetFacade

	Name	Type	Description
<b>Parameters</b>	<code>op=updateunlockflag</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>flag=[true or false]</code>	boolean	<b>True</b> for locked, <b>false</b> for unlocked. (Mandatory)
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/assets/relations/19?op=updateunlockflag&amp;flag=true</code>		

### checkIn

<b>Function</b>	Check in a checked out asset.		
<b>Description</b>	This request checks in a checked out asset. Include the file in the request body or as file part.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	checkIn	com.quark.qpp.service.facade Class AssetFacade	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=checkin</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This request will not work if the asset is not checked out.
	<code>attributevalues=&lt;xml/&gt;</code>		<p>See “Request/Response parameter formats.”</p> <p>The following attributes are Mandatory:</p> <ul style="list-style-type: none"> <li>• Collection (There is a choice between collection <b>ID</b>, <b>Name</b> and <b>Path</b> when providing a value for the <b>Collection</b>attribute.)</li> <li>• Workflow</li> <li>• Status</li> <li>• Name</li> </ul>
	<code>relations=&lt;xml/&gt;</code>		<p>See “Request/Response parameter formats.”</p> <p>If given a value in this request parameter, the Quark Publishing Platform Server will check-in a checked-out asset and create a relation with the specified parent asset at</p>

			<p>the same time. (Optional)</p> <p>For <b>Secondary Attachment</b> and <b>Overlay Attachment</b> the following attributes are Mandatory:</p> <ul style="list-style-type: none"> <li>• ATTACHED_LAYOUT_ID</li> <li>• BOX_ID</li> <li>• PAGE_NAME</li> <li>• PAGE_INDEX</li> </ul> <p>For <b>Primary Attachment</b> the following attribute is also Mandatory ins addition to the above mentioned four attributes:</p> <ul style="list-style-type: none"> <li>• ATTACHED_COMPONENT_ID</li> </ul> <p>For <b>ArticleComponent Ref Attachment</b> the following two attributes are also Mandatory ins addition to the above mentioned four attributes:</p> <ul style="list-style-type: none"> <li>• ARTICLE_ID</li> <li>• ARTICLE_COMPONENT_ID</li> </ul>
	<pre>createminorversion =[true   false]</pre>	boolean	<p>Specify whether to create a minor version or not.</p> <p>Defaults to <b>false</b>. (Optional)</p>
Returns	Returns the <code>assetInfo</code> object of the latest version of the asset to be checked into the QPP server.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/4?op=checkin&amp; attributevalues= &lt;attributeValueList &gt;     &lt;attributeValue id="2"&gt;1quark2.jpg&lt;/attributeValue&gt;     &lt;attributeValue id="54"&gt;10&lt;/attributeValue&gt;     &lt;attributeValue id="55"&gt;1&lt;/attributeValue&gt;     &lt;attributeValue id="24"&gt;10&lt;/attributeValue&gt;     &lt;attributeValue id="11"&gt;jpg&lt;/attributeValue&gt;     &lt;attributeValue id="33"&gt;1quark2.jpg&lt;/attributeValue&gt;     &lt;attributeValue id="25"&gt;admin&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;assetInfo id="4"&gt;     &lt;assetVersion minorVersion="1" majorVersion="0"/&gt;     &lt;attributeValueList&gt;         &lt;attributeValue type="numeric" name="Id" id="1"&gt;4&lt;/attributeValue&gt;         &lt;attributeValue type="text" name="Name" id="2"&gt;1quark2.jpg&lt;/attributeValue&gt;         ...     &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre> <p><b>Result:</b></p> <p>The <code>assetInfo</code> object of the latest version of the asset to be checked into the QPP</p>		

	server.
--	---------

**checkInNew**

<b>Function</b>	Check in a new asset.		
<b>Description</b>	Include the file in the request body or as file part.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assetsbypath/[asset path] or /assets/[New Asset Name]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>checkInNew</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=checkinnew</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributevalues=&lt;xml/&gt;</code>		<p>See “Request/Response parameter formats.”</p> <pre>&lt;attributeValueList&gt;   &lt;attributeValue id="62"&gt;     1103 &lt;/attributeValue&gt;   &lt;attributeValue id="54"&gt; 10   &lt;attributeValue id="24"&gt; 10   &lt;attributeValue id="11"&gt; jpg   &lt;attributeValue id="33"&gt;     Original file   &lt;/attributeValue&gt;   &lt;attributeValue id="25"&gt; 1 &lt;/attributeValue&gt; &lt;/attributeValueList&gt;</pre> <p>The following attributes are Mandatory:</p> <ul style="list-style-type: none"> <li>Content type (There is a choice between content type ID, Name and Hierarchy when providing a value for the Content type attribute.)</li> <li>Collection (There is a choice between collection ID, Name and Path when providing a value for the Collection attribute).</li> <li>Workflow</li> <li>Status</li> <li>File extension</li> <li>Original filename</li> </ul>
	<code>relations=&lt;xml/&gt;</code>		See “Request/Response parameter formats.”

			If this parameter is passed, the QPP Server will check-in the asset and create child relations with the new asset being checked in at the same time. (Optional).
	<code>createminorversion =[true   false]</code>	boolean	Specify if this version of the asset is to be checked in to the QPP server as a major or a minor version. (Optional)
<b>Returns</b>	Returns an <code>assetInfo</code> object of the newly checked in asset with its metadata.		
	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assetsbypath/Home/Tulips?attributevalues= &lt;attributeValueList&gt;   &lt;attributeValue     id="62"&gt;System;Asset;Picture;&lt;/attributeValue&gt;     &lt;attributeValue id="54"&gt;10&lt;/attributeValue&gt;     &lt;attributeValue id="24"&gt;10&lt;/attributeValue&gt;     &lt;attributeValue id="11"&gt;jpg&lt;/attributeValue&gt;     &lt;attributeValue id="33"&gt;Original file&lt;/attributeValue&gt;     &lt;attributeValue id="25"&gt;1&lt;/attributeValue&gt;   &lt;/attributeValueList&gt; &amp;op=checkinnew</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="10"&gt;   &lt;assetVersion minorVersion="0" majorVersion="1"/&gt;   &lt;attributeValueList&gt;     &lt;attributeValue type="numeric" name="Id"       id="1"&gt;10&lt;/attributeValue&gt;     &lt;attributeValue type="text" name="Name"       id="2"&gt;Tulips&lt;/attributeValue&gt;     &lt;attributeValue type="dateTime" name="Created"       id="3"&gt;2013-04-11T05:12:51Z&lt;/attributeValue&gt;     &lt;attributeValue type="dateTime" name="Last modified"       id="4"&gt;2013-04-11T05:12:51Z&lt;/attributeValue&gt;     &lt;attributeValue type="popup" name="Creator"       id="5"&gt;Admin&lt;/attributeValue&gt;     &lt;attributeValue type="popup" name="Last modifier"       id="6"&gt;Admin&lt;/attributeValue&gt;     &lt;attributeValue type="numeric" name="Major version"       id="7"&gt;1&lt;/attributeValue&gt;     &lt;attributeValue type="text" name="File path"       id="8"/&gt;/00/0a/10.1-0.1.1.jpg&lt;/attributeValue&gt;     &lt;attributeValue type="text" name="File extension"       id="11"&gt;jpg&lt;/attributeValue&gt;     &lt;attributeValue type="numeric" name="File size"       id="12"&gt;115191&lt;/attributeValue&gt;     &lt;attributeValue type="boolean" name="Is checked out"       id="13"&gt;false&lt;/attributeValue&gt;     &lt;attributeValue type="dateTime" name="Last content update"       id="19"&gt;2013-04-11T05:12:51Z&lt;/attributeValue&gt;     &lt;attributeValue type="popup" name="Last content updated by"       id="20"&gt;Admin&lt;/attributeValue&gt;     &lt;attributeValue type="popup" name="Routed to"       id="25"&gt;Admin&lt;/attributeValue&gt;     &lt;attributeValue type="popup" name="Status"       id="24"&gt;Status1&lt;/attributeValue&gt;     &lt;attributeValue type="popup" name="Repository type"       id="27"&gt;fileRepositoryAdapter&lt;/attributeValue&gt;     &lt;attributeValue type="popup" name="Indexing status"       id="29"&gt;Pending&lt;/attributeValue&gt;</pre>		
<b>Examples</b>			

	<pre> &lt;attributeValue type="popup" name="Repository" id="28"&gt;QPS_Repo&lt;/attributeValue&gt; &lt;attributeValue type="boolean" name="Is placeholder" id="30"&gt;false&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Content creator" id="32"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue type="text" name="Original filename" id="33"&gt;Original file&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Collection" id="55"&gt;Home&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Workflow" id="54"&gt;Workflow1&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Content Type" id="62"&gt;Picture&lt;/attributeValue&gt; &lt;attributeValue type="numeric" name="Minor version" id="61"&gt;0&lt;/attributeValue&gt; &lt;attributeValue type="boolean" name="Has Children" id="65"&gt;false&lt;/attributeValue&gt; &lt;attributeValue type="text" name="Collection Path" id="57"&gt;Home&lt;/attributeValue&gt; &lt;attributeValue type="text" name="Content Type Hierarchy" id="63"&gt;System;Asset;Picture&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre>

**checkInArticle**

<b>Function</b>	Check in a checked-out QuarkCopyDesk article with components.		
<b>Description</b>	This request checks in a checked out article. Include the file in the request body or as file part.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assetsbypath/[asset path] or /assets/[asset name]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>checkInArticle</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=checkinarticle</code>	string	<p>The op parameter allows you to specify which operation is to be performed. (Mandatory)</p> <p>This request will not work if the asset is not checked out.</p>
	<code>attributevalues=&lt;xml/&gt;</code>		<p>See “Request/Response parameter formats.” The following attributes are Mandatory:</p> <ul style="list-style-type: none"> <li>• Collection (There is a choice between collection <b>ID</b>, <b>Name</b> and <b>Path</b> when providing a value for the <b>Collection</b> attribute.)</li> <li>• Workflow</li> <li>• Status</li> </ul>

			<ul style="list-style-type: none"> <li>• Name</li> </ul>
	relations=<xml/>		<p>See “Request/Response parameter formats.”</p> <p>If given a value in this request parameter, the Quark Publishing Platform Server will check-in a checked-out asset and create a relation with the specified parent asset at the same time. (Optional)</p>
	createminorversion=[true   false]	boolean	<p>Specify whether to create a minor version or not.</p> <p>Defaults to <b>false</b>. (Optional)</p>
Returns	Returns the assetInfo object of the latest version of the asset to be checked into the QPP server.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assetsbypath/Home/15116d12.qcd?op=checkin&amp;attributevalues= &lt;attributeValueList&gt;     &lt;attributeValue id="2"&gt;15348a77.qcd&lt;/attributeValue&gt;     &lt;attributeValue id="54"&gt;Workflow1&lt;/attributeValue&gt;     &lt;attributeValue id="55"&gt;Home&lt;/attributeValue&gt;     &lt;attributeValue id="24"&gt;Status1&lt;/attributeValue&gt;     &lt;attributeValue id="11"&gt;qcd&lt;/attributeValue&gt;     &lt;attributeValue id="33"&gt;15348a77.qcd&lt;/attributeValue&gt;     &lt;attributeValue id="25"&gt;1&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &amp; components= &lt;articleComponentInfoList&gt;     &lt;articleComponentInfo componentId="15"&gt;         &lt;attributeValueList&gt;             &lt;attributeValue name="Component Name"&gt;Component 1&lt;/attributeValue&gt;             &lt;attributeValue name="Content Type"&gt;1250&lt;/attributeValue&gt;             &lt;attributeValue name="Article Component Id"&gt;1&lt;/attributeValue&gt;         &lt;/attributeValueList&gt;     &lt;/articleComponentInfo&gt;     &lt;articleComponentInfo componentId="14"&gt;         &lt;attributeValueList&gt;             &lt;attributeValue name="Component Name"&gt;Component2&lt;/attributeValue&gt;             &lt;attributeValue name="Content Type"&gt;1300&lt;/attributeValue&gt;             &lt;attributeValue name="Article Component Id"&gt;2&lt;/attributeValue&gt;         &lt;/attributeValueList&gt;     &lt;/articleComponentInfo&gt; &lt;/articleComponentInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="53"&gt;     &lt;assetVersion minorVersion="0" majorVersion="1"/&gt;     &lt;attributeValueList&gt;         &lt;attributeValue valueId="0" type="numeric" name="Id" id="1"&gt;53&lt;/attributeValue&gt;         &lt;attributeValue valueId="0" type="text" name="Name"&gt;</pre>		

	<pre>         id="2"&gt;15116d12.qcd&lt;/attributeValue&gt;           &lt;attributeValue valueId="0" type="dateTime"             name="Created" id="3"&gt;2014-04-09T09:51:45Z&lt;/attributeValue&gt;               &lt;attributeValue valueId="0" type="dateTime" name="Last                 modified" id="4"&gt;2014-04-09T09:51:45Z&lt;/attributeValue&gt;                 &lt;attributeValue valueId="1" type="popup" name="Creator"                   id="5"&gt;Admin&lt;/attributeValue&gt;                   &lt;attributeValue valueId="1" type="popup" name="Last                     modifier" id="6"&gt;Admin&lt;/attributeValue&gt;                     &lt;attributeValue valueId="0" type="numeric" name="Major                       version" id="7"&gt;1&lt;/attributeValue&gt;                       &lt;attributeValue valueId="0" type="text" name="File path"                         id="8"&gt;/00/35/53.1-0.1.1.qcd&lt;/attributeValue&gt;                         &lt;attributeValue valueId="0" type="text" name="File                           extension" id="11"&gt;qcd&lt;/attributeValue&gt;                           &lt;attributeValue valueId="0" type="numeric" name="File                             size" id="12"&gt;284672&lt;/attributeValue&gt;                             &lt;attributeValue valueId="0" type="boolean" name="Is                               checked out" id="13"&gt;false&lt;/attributeValue&gt;                               &lt;attributeValue valueId="0" type="dateTime" name="Last                                 content update" id="19"&gt;2014-04-09T09:51:45Z&lt;/attributeValue&gt;                                 &lt;attributeValue valueId="1" type="popup" name="Last                                   content updated by" id="20"&gt;Admin&lt;/attributeValue&gt;                                   &lt;attributeValue valueId="1" type="popup" name="Routed                                     to" id="25"&gt;Admin&lt;/attributeValue&gt;                                     &lt;attributeValue valueId="10" type="popup" name="Status"                                       id="24"&gt;Status1&lt;/attributeValue&gt;                                       &lt;attributeValue valueId="1" type="popup"   name="Repository type"   id="27"&gt;fileRepositoryAdapter&lt;/attributeValue&gt;   &lt;/attributeValueList&gt;   &lt;/assetInfo&gt; </pre>
--	--

**checkInNewArticle**

<b>Function</b>	Check in a new QuarkCopyDesk Article with components.		
<b>Description</b>	Include the file in the request body or as file part.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../assetsbypath/[asset path] or /assets/[asset name]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>checkInNewArticle</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=checkinnewarticle</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributevalues=&lt;xml/&gt;</code>		See "Request/Response parameter formats."  <code>&lt;attributeValueList&gt;</code> <code>&lt;attributeValue id="62"&gt; 1103</code> <code>&lt;/attributeValue&gt;</code> <code>&lt;attributeValue id="54"&gt; 10</code> <code>&lt;/attributeValue&gt;</code> <code>&lt;attributeValue id="24"&gt; 10</code> <code>&lt;/attributeValue&gt;</code> <code>&lt;attributeValue id="11"&gt; jpg</code>

			<pre> &lt;/attributeValue&gt; &lt;attributeValue id="33"&gt; Original file &lt;/attributeValue&gt; &lt;attributeValue id="25"&gt; 1 &lt;/attributeValue&gt; &lt;/attributeValueList&gt; </pre> <p>The following attributes are Mandatory:</p> <ul style="list-style-type: none"> <li>Content type (There is a choice between content type <b>ID</b>, <b>Name</b> and <b>Hierarchy</b> when providing a value for the <b>Content type</b> attribute.)</li> <li>Collection (There is a choice between collection <b>ID</b>, <b>Name</b> and <b>Path</b> when providing a value for the <b>Collection</b> attribute)</li> <li>Workflow</li> <li>Status</li> <li>File extension</li> <li>Original filename</li> </ul>
	relations=<xml/>		<p>See “Request/Response parameter formats.”</p> <p>If this parameter is passed, the QPP Server will check-in the asset and create child relations with the new asset being checked in at the same time. (Optional).</p>
	createminorversion=[true   false]	boolean	Specify if this version of the asset is to be checked in to the QPP server as a major or a minor version. (Optional)
Returns	Returns an <code>assetInfo</code> object of the newly checked in asset with its metadata.		
Examples	<p><b>URL:</b></p> <pre> http://serverName:serverPort/rest/service/assets/15116d12.qcd? op=checkinnew&amp;attributevalues= &lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;attributeValueList&gt; &lt;attributeValue id="62"&gt;11011&lt;/attributeValue&gt; &lt;attributeValue name="workflow"&gt;Workflow1&lt;/attributeValue&gt; &lt;attributeValue name="collection"&gt;1&lt;/attributeValue&gt; &lt;attributeValue id="24"&gt;10&lt;/attributeValue&gt; &lt;attributeValue id="11"&gt;qcd&lt;/attributeValue&gt; &lt;attributeValue id="33"&gt;15348.qcd&lt;/attributeValue&gt; &lt;attributeValue name="routed to"&gt;1&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &amp;createminorversion=false&amp;components= &lt;articleComponentInfoList&gt; &lt;articleComponentInfo&gt; &lt;attributeValueList&gt; &lt;attributeValue name="Component Name"&gt;Component1&lt;/attributeValue&gt; &lt;attributeValue name="Content Type"&gt;1250&lt;/attributeValue&gt; </pre>

**checkInRendition**

<b>Function</b>	Check in a rendition of an asset.
<b>Description</b>	Include the file in the request body or as file part.

Type	POST		
URL Format	<code>.../assetsbypath/[asset path] or /assets/[assetId]</code>		
Java API	Method Name		Class Name
	<code>checkInRendition</code>		<code>com.quark.qpp.service.facade</code> <code>AssetFacade</code>
Parameters	Name	Type	Description
	<code>op=checkinrendition</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>rendition=highres</code> or <code>rendition=1</code>	string	Specify the required rendition type. (Optional) If the parameter is not passed the system returns the highres rendition type of the asset. Available renditions types are:PREVIEWTHUMBNAILARTICLE_PAGE_PICTUREDECONSTRUCTED_XMLTEXT
	<code>fileext=[file extension]</code>	string	The file extension of the rendition files being checked in. (Mandatory)
	<code>pages=[pages]</code>	long	The number of pages contained in the rendition being created. (Optional)
	<code>majorversion=[x]</code> and <code>minorversion=[x]</code>	long	Specify the required major and minor version for which the given rendition of an asset is required. (Optional) These parameters will be used collectively. If neither parameter is passed, the latest version of the asset will be considered. If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
	A status of 200 is returned in response to a successful request execution.		
Examples	<p><b>URL:</b></p> <pre><code>http://serverName:serverPort/rest/service/assets/4?rendition=prev iew&amp;fileext=jpg&amp; majorversion=0&amp;minorversion=2&amp;op=checkinrendition</code></pre>		

## checkOut

Function	Check out an asset	
Description	This request checks out the specified asset and returns its stream.	
Type	POST	
URL Format	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>	
Java API	Method Name	Class Name
	<code>checkOut</code>	<code>com.quark.qpp.service.facade</code>

			Class AssetFacade
Parameters	Name	Type	Description
	op=checkout	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
			<p>See “Request/Response parameter formats.”</p> <pre>&lt;attributeValueList&gt; &lt;attributeValue id="16"&gt; E:\REST\QPP Rest\TestData\CheckoutFilePath &lt;/attributeValue&gt; &lt;attributeValue id="34"&gt; REST _CLIENT &lt;/attributeValue&gt; &lt;/attributeValueList&gt;</pre> <p>The following attributes are Mandatory:</p> <ul style="list-style-type: none"> <li>• CHECKOUT_FILE_PATH</li> <li>• CHECKOUT_APPLICATION</li> </ul>
Returns	Returns an asset stream after marking it checked out.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/4?attributevalues= &lt;attributeValueList&gt; &lt;attributeValue id="16"&gt;E:\REST\QPP Rest\TestData\CheckoutFilePath&lt;/attributeValue&gt; &lt;attributeValue id="34"&gt;REST _CLIENT&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &amp;op=checkout</pre> <p><b>Result:</b></p> <p>An asset stream after marking it checked out.</p>		

### abortCheckout

Function	Abort checkout of an asset		
Description	This request aborts the check-out of an asset that is marked as checked-out.		
Type	POST		
URL Format	<code>.../assetsbypath/[asset path] or /assets/[asset ID]</code>		
Java API	Method Name		Class Name
	abortCheckout		com.quark.qpp.service.facade Class AssetFacade
Parameters	Name	Type	Description
	op=abortcheckout	string	<p>The op parameter allows you to specify which operation is to be performed. (Mandatory)</p> <p>This request will not work if the asset is not checked out.</p>

<b>Returns</b>	Returns an <code>assetInfo</code> object in XML format.
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/4?op=abortcheckout &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="4"&gt;   &lt;assetVersion minorVersion="2" majorVersion="0"/&gt;   &lt;attributeValueList&gt;     &lt;attributeValue type="numeric" name="Id"&gt;1&lt;/attributeValue&gt;     &lt;attributeValue type="text" name="Name"&gt;1quark2.jpg&lt;/attributeValue&gt;     &lt;attributeValue type="dateTime" name="Created" id="3"&gt;2013-04-10T09:37:56Z&lt;/attributeValue&gt;     ....   &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre> <p><b>Result:</b></p> <p>The <code>assetInfo</code> object in XML format.</p>

### saveDraft

<b>Function</b>	Saves the draft copy of an asset.		
<b>Description</b>	This request saves the asset without creating a new version of the asset.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>/assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>saveDraft</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=savedraft</code>	string	Include the file in the request body or as file part. (Mandatory)
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/{asset Id}?op=savedraft</pre>		

### promoteDraft

<b>Function</b>	Promotes the draft version to the actual version of an asset.		
<b>Description</b>	This request saves the asset without creating a new version of the asset.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>/assets/[asset ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>promoteDraft</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>

	Name	Type	Description
Parameters	op=promotedraft	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	attributes= [comma-separated list of attribute names or IDs]	string	List of attribute values to be set for this new asset version. For a list of attributes, use a call to admin/attributes. (Mandatory)
	Createminorversion={true false}	string	By default value is false.
Returns	Returns an <code>assetInfo</code> object along with a list of attribute values for this new asset version.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets/{assetId}?op=promotedraft</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="40"&gt;     &lt;assetVersion minorVersion="0" majorVersion="3"/&gt;     &lt;attributeValueList&gt;         &lt;attributeValue type="numeric" name="Id" id="1"&gt;40&lt;/attributeValue&gt;         &lt;attributeValue type="text" name="Name" id="2"&gt;abc.xlsx&lt;/attributeValue&gt;         &lt;attributeValue type="dateTime" name="Created" id="3"&gt;2014-08-18T07:23:30Z&lt;/attributeValue&gt;         ....     &lt;/attributeValueList/&gt; &lt;/assetInfo&gt;</pre>		

### detectContentType

Function	Detects content type of provided asset. Pass asset as stream in the request body.		
Description	This request detects the content type of a provided asset.		
Type	POST		
URL Format	<code>.../assets</code>		
Java API	Method Name		Class Name
	<code>detectContentType</code>		<code>com.quark.qpp.service.facade</code> <code>Class AssetFacade</code>
Parameters	Name	Type	Description
	<code>fileextension</code>	string	The file extension of the asset.
	<code>mimetype</code>	string	The mime type of the asset.
Returns			
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/assets?op=detectcontenttype</pre>		

	<p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;contentTypeInfo id="11011"&gt;     &lt;name&gt;QuarkCopyDesk Article&lt;/name&gt;     &lt;contentTypeHierarchy&gt;System;Asset;Document;QuarkCopyDesk Article;&lt;/contentTypeHierarchy&gt;     &lt;systemDefined&gt;true&lt;/systemDefined&gt;     &lt;childrenAvailable&gt;false&lt;/childrenAvailable&gt;     &lt;extensible&gt;true&lt;/extensible&gt; &lt;/contentTypeInfo&gt;</pre>

## Collection management

The collection management capabilities of the API allow application developers to manage collections and includes the following REST calls:

- *createCollection*
- *createCollections*
- *getCollection*
- *getCollectionHierarchy*
- *getCollectionDefaultJobJacket*
- *getCollectionDefaultTicket*
- *moveCollection*
- *duplicateCollection*
- *updateCollection*
- *updateCollections*
- *deleteCollection*
- *deleteCollectionWithAssets*
- *createJobJackets*
- *getJobJacket*
- *getAllJobJackets*
- *getJobJacketContent*
- *updateJobJacket*
- *updateJobJackets*
- *parseJobJacketXml*
- *deleteJobJacket*
- *getApplicableRoutingUsers*
- *getApplicablePrivileges*
- *getApplicableRoutingGroups*
- *getApplicableAttributeConstraints*

## REST FRAMEWORK SERVICES

- *getApplicableStatusTransition*
- *getApplicableWorkflowInitialStatuses*

### createCollection

<b>Function</b>	Create a collection.		
<b>Description</b>	This request creates a new collection according to the given attributes.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/[collection name] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createCollection</code>		<code>com.quark.qpp.service.facade Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>targetparent=[collection path or ID]</code>	long or string	The parent collection for the new collection. (Mandatory)  There is a choice between collection ID, Name and Path when providing a value.
	<code>attributevalues=&lt;xml/&gt;</code>	string	The set of attribute values.  See "Request/Response parameter formats."(All attributes are Optional)
	<code>contenttype=[content type name]</code>	string	Defaults to <b>GENERAL</b> .  The default content type IDs are documented in the JavaDoc SDK at <code>com.quark.qpp.core.content.service.constants.DefaultContentTypes</code> .  To get a list of content types, use a call to <code>.../admin/contenttypes</code> .(Optional)  There is a choice between content type ID, Name and Hierarchy when providing a value.
<b>Returns</b>	Returns the <code>collectionInfo</code> object of the newly created collection.		
<b>Examples</b>	<b>URL:</b>  <code>http://serverName:serverPort/rest/service/collections/newChildCollection? op=create&amp;targetparent=Home/childCollection</code>		
	<b>Result:</b>  <code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;   &lt;collectionInfo templateId="0"     collectionClass="General"</code>		

```

collectionClassId="1416"
collectionTemplate="false"
accessibleChildrenAvailable="true"
domainId="19"
name="newChildCollection"
id="15">
<attributeValueList>
<attributeValue type="numeric"
    name="Id"
    id="1">1</attributeValue>
...
</attributeValueList>
<workflowInfoList>
<workflowInfo id="10">
<name>Workflow1</name>
...
<statusInfoList>
<statusInfo id="10">
<name>Status1</name>
...
</statusInfo>
</statusInfoList>
</workflowInfo>
...
...
</collectionInfo>

```

<b>Function</b>	Create a collection template.		
<b>Description</b>	This request creates a new collection template under the given parent collection.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/[collection name] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>createCollection</code>	<code>com.quark.qpp.service.facade Class CollectionFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>istemplate=[true false]</code>	boolean	Defaults to <b>false</b> . (Mandatory)
	<code>targetparent=[collection path or ID]</code>	long or string	The parent collection for the new collection. (Mandatory)
	<code>attributevalues=&lt;xml/&gt;</code>	string	The set of attribute values.  See "RequestResponse parameter formats."  All attributes are Optional.
	<code>contenttype=[content type name]</code>	string	Defaults to <b>GENERAL</b> . The default content type IDs are documented in the JavaDoc SDK at <code>com.quark.qpp.core.content.service.constants.DefaultContentTypes</code> .

## REST FRAMEWORK SERVICES

		To get a list of content types, use a call to .../admin/contenttypes.(Optional)
Returns	Returns the <code>collectionInfo</code> object of the newly created collection template.	
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/newChildCollection? op=create&amp;targetparent=Home/childCollection&amp;istemplate=true</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfo templateId="0"   collectionClass="General"   collectionClassId="1416"   collectionTemplate="false"   accessibleChildrenAvailable="true"   domainId="19"   name="newChildCollection"   id="15"&gt;   &lt;attributeValueList&gt;     &lt;attributeValue type="numeric" name="Id" id="1"&gt;1&lt;/attributeValue&gt;     ...   &lt;/attributeValueList&gt;   &lt;workflowInfoList&gt;     &lt;workflowInfo id="10"&gt;       &lt;name&gt;Workflow1&lt;/name&gt;     ...   &lt;/statusInfoList&gt;     &lt;statusInfo id="10"&gt;       &lt;name&gt;Status1&lt;/name&gt;     ...   &lt;/statusInfo&gt;   &lt;/statusInfoList&gt; &lt;/workflowInfo&gt; ... ... &lt;/collectionInfo&gt;</pre>	

### createCollections

Function	Create multiple collections.		
Description	This request creates multiple collections in a single request.		
Type	POST		
URL Format	<code>.../collections</code>		
Java API	Method Name		Class Name
	<code>createCollections</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
Parameters	Name	Type	Description
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation will run only for a valid session id.

	<code>collectioninfolist=&lt;x ml/&gt;</code>		See “Request/Response parameter formats.”
Returns	Returns a <code>collectioninfolist</code> object in XML format that contains the metadata of all successfully created collections.		
URL:	<pre>https://serverName:serverPort/rest/service/collections?op=create&amp;collectioninfolist=&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;collectionInfoList&gt;     &lt;collectionInfo collectionClassId="1416"         collectionTemplate="false"         collectionPath="Home/Home3" &gt;         &lt;attributeValueList&gt;             &lt;attributeValue valueId="0" type="text" name="Name"                 id="2"&gt;Home3&lt;/attributeValue&gt;             &lt;attributeValue valueId="0" type="dateTime"                 name="Created" id="3"&gt;2010-04-01T10:00:00Z&lt;/attributeValue&gt;             &lt;attributeValue valueId="0" type="dateTime" name="Last                 modified" id="4"&gt;2010-04-01T10:00:00Z&lt;/attributeValue&gt;             &lt;attributeValue valueId="1" type="popup"                 name="Creator" id="5"&gt;Admin&lt;/attributeValue&gt;             &lt;attributeValue valueId="1" type="popup" name="Last                 modifier" id="6"&gt;Admin&lt;/attributeValue&gt;             &lt;attributeValue valueId="0" type="boolean" name="Is                 Template" id="59"&gt;false&lt;/attributeValue&gt;             &lt;attributeValue valueId="0" type="text"                 name="Collection Path" id="57"&gt;Home/Home1&lt;/attributeValue&gt;             &lt;attributeValue valueId="1416" type="popup"                 name="Content Type" id="62"&gt;General&lt;/attributeValue&gt;             &lt;attributeValue valueId="0" type="text" name="Content                 Type Hierarchy"                 id="63"&gt;System;Collection;General&lt;/attributeValue&gt;         &lt;/attributeValueList&gt;     &lt;/collectionInfo&gt; &lt;/collectionInfoList&gt;</pre>		
Examples	<p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfoList&gt;     &lt;collectionInfo         defaultJobJacketTicket="Default Job Ticket"         defaultJobJacketName="Default Job Jacket"         defaultJobJacketId ="1"         templateId="0"         collectionClass="General"         collectionClassId="1416"         collectionTemplate="false"         accessibleChildrenAvailable="false"         domainId="19"         collectionPath="Home/Home3"         name="Home3"         id="23"&gt;         &lt;attributeValueList&gt;             &lt;attributeValue valueId="0" type="numeric" name="Id"                 id="1"&gt;23&lt;/attributeValue&gt;             &lt;attributeValue valueId="0" type="text" name="Name"                 id="2"&gt;Home3&lt;/attributeValue&gt;             &lt;attributeValue valueId="0" type="dateTime"                 name="Created" id="3"&gt;2014-04-10T06:09:46Z&lt;/attributeValue&gt;             ...         &lt;/attributeValueList&gt;     &lt;/collectionInfo&gt; &lt;/collectionInfoList&gt;</pre>		

```

<routingInfoList/>
<userInfoList>
  <userInfo id="1">
    <name>Admin</name >
    ....
  </userInfo>
</userInfoList>
<groupInfoList/>
<jobJacketInfoList>
  <jobJacketInfo id="1">
    <name>Default Job Jacket</name>
    ....

</collectionInfo>
</collectionInfoList>

```

**getCollection**

<b>Function</b>	Get all of a collection's metadata.	
<b>Description</b>	This request returns all of the metadata associated with an entire collection.	
<b>Type</b>	GET	
<b>URL Format</b>	.../collections/[collection ID] or collectionsbypath/[collection path]	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	getCollection	com.quark.qpp.service.facade Class CollectionFacade
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>collectionInfo</code> object with all its metadata and a list of its attributes.	
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/collections/1</code>	
	<b>Result:</b> <pre> &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfoList&gt;   &lt;collectionInfo     defaultJobJacketTicket="Default Job Ticket"     defaultJobJacketName="Default Job Jacket"     defaultJobJacketId="1"     templateId="0"     collectionClass="General"     collectionClassId="1416"     collectionTemplate="false"     accessibleChildrenAvailable="true"     domainId="19"     collectionPath="Home"     name="Home"     id="1"&gt;     &lt;attributeValueList&gt;       &lt;attributeValue valueId="0" type="numeric" name="Id" id="1"&gt;1&lt;/attributeValue&gt;         &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;Home&lt;/attributeValue&gt;         &lt;attributeValue valueId="0" type="dateTime"&gt; </pre>	

```

        name="Created" id="3">2010-04-01T10:00:00Z</attributeValue>
            <attributeValue valueId="0" type="dateTime" name="Last modified" id="4">2013-12-23T12:07:27Z</attributeValue>
                <attributeValue valueId="1" type="popup" name="Creator" id="5">Admin</attributeValue>
                    <attributeValue valueId="1" type="popup" name="Last modifier" id="6">Admin</attributeValue>
                        <attributeValue valueId="0" type="boolean" name="Is Template" id="59">false</attributeValue>
                            <attributeValue valueId="0" type="text" name="Collection Path" id="57">Home</attributeValue>
                                <attributeValue valueId="1416" type="popup" name="Content Type" id="62">General</attributeValue>
                                    <attributeValue valueId="0" type="text" name="Content Type Hierarchy" id="63">System;Collection;General</attributeValue>
                                        </attributeValueList>
                                    </collectionInfo>
                                </collectionInfoList>
    
```

<b>Function</b>	Get specific collection attributes.		
<b>Description</b>	This request returns all of the attributes associated with a specific collection.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getCollection</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>attributes=[attribute name or ID], [attribute name or ID], ...</code>	<code>string</code>	To get a list of all attribute IDs, use a call to <code>.../admin/attributes</code> . (Mandatory)
<b>Returns</b>	Returns a <code>collectionInfo</code> object with the specified attributes.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/1?attributes=1,name,creator</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfo id="1"&gt;     &lt;attributeValueList&gt;         &lt;attributeValue type="numeric" name="Id" id="1"&gt;1&lt;/attributeValue&gt;         &lt;attributeValue type="text" name="Name" id="2"&gt;Home&lt;/attributeValue&gt;         &lt;attributeValue type="popup" name="Creator" id="5"&gt;Admin&lt;/attributeValue&gt;     &lt;/attributeValueList&gt; &lt;/collectionInfo&gt;</pre>		

<b>Function</b>	Get a collection's workflows.
<b>Description</b>	This request returns all of the workflows associated with a collection.

## REST FRAMEWORK SERVICES

Type	GET		
URL Format	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
Java API	Method Name		Class Name
	<code>getCollection</code>		com.quark.qpp.service.facade Class CollectionFacade
Parameters	Name	Type	Description
	<code>workflows=[true false]</code>	boolean	Defaults to <b>false</b> . (Mandatory)
Returns	Returns a <code>collectionInfo</code> object with the metadata of the workflows only.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/1?workflows=true</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfoList&gt;   &lt;collectionInfo     defaultJobJacketTicket="Default Job Ticket"     defaultJobJacketName="Default Job Jacket"     defaultJobJacketId="1"     templateId="0"     collectionClass="General"     collectionClassId="1416"     collectionTemplate="false"     accessibleChildrenAvailable="true"     domainId="19"     collectionPath="Home"     name="Home"     id="1"&gt;     &lt;attributeValueList&gt;       &lt;attributeValue valueId="0" type="numeric" name="Id" id="1"&gt;1&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;Home&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="dateTime" name="Created" id="3"&gt;2010-04-01T10:00:00Z&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="dateTime" name="Last modified" id="4"&gt;2013-12-23T12:07:27Z&lt;/attributeValue&gt;       &lt;attributeValue valueId="1" type="popup" name="Creator" id="5"&gt;Admin&lt;/attributeValue&gt;       &lt;attributeValue valueId="1" type="popup" name="Last modifier" id="6"&gt;Admin&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="boolean" name="Is Template" id="59"&gt;false&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="text" name="Collection Path" id="57"&gt;Home&lt;/attributeValue&gt;       &lt;attributeValue valueId="1416" type="popup" name="Content Type" id="62"&gt;General&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="text" name="Content Type Hierarchy" id="63"&gt;System;Collection;General&lt;/attributeValue&gt;     &lt;/attributeValueList&gt;     &lt;workflowInfoList&gt;       &lt;workflowInfo id="10"&gt;         &lt;name&gt;Workflow1&lt;/name&gt;         &lt;domainId&gt;18&lt;/domainId&gt;         .....     &lt;/workflowInfoList&gt;   &lt;/collectionInfo&gt; &lt;/collectionInfoList&gt;</pre>

```

<b>Function</b>	Get a collection's parent collection.
<b>Description</b>	This request returns all of the accessible parent collections for a collection.
<b>Type</b>	GET

<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getCollection</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>parentcollections</code> <code>= [true false]</code>	<code>boolean</code>	Defaults to <code>false</code> . (Mandatory)
<b>Returns</b>	Returns a <code>collectionInfo</code> object of ancestor collections up the hierarchy based on access control. While going up the hierarchy, if there exists any inaccessible collection (for which the logged on user does not have access to), the collection path array will contain <code>collectionInfo</code> objects of only those collections which are lying below that collection.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/10?parentcollections=true</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfoList&gt;   &lt;collectionInfo     defaultJobJacketTicket="Default Job Ticket"     defaultJobJacketName="Default Job Jacket"     defaultJobJacketId="1"     templateId="0"     collectionClass="General"     collectionClassId="1416"     collectionTemplate="false"     accessibleChildrenAvailable="true"     domainId="19"     collectionPath="Home"     name="Home" id="1"&gt;     &lt;attributeValueList&gt;       &lt;attributeValue valueId="0" type="numeric" name="Id" id="1"&gt;1&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;Home&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="dateTime" name="Created" id="3"&gt;2010-04-01T10:00:00Z&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="dateTime" name="Last modified" id="4"&gt;2013-12-23T12:07:27Z&lt;/attributeValue&gt;       &lt;attributeValue valueId="1" type="popup" name="Creator" id="5"&gt;Admin&lt;/attributeValue&gt;       &lt;attributeValue valueId="1" type="popup" name="Last modifier" id="6"&gt;Admin&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="boolean" name="Is Template" id="59"&gt;false&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="text" name="Collection Path" id="57"&gt;Home&lt;/attributeValue&gt;       &lt;attributeValue valueId="1416" type="popup" name="Content Type" id="62"&gt;General&lt;/attributeValue&gt;       &lt;attributeValue valueId="0" type="text" name="Content Type Hierarchy" id="63"&gt;System;Collection;General&lt;/attributeValue&gt;     &lt;/attributeValueList&gt;   &lt;/collectionInfo&gt; &lt;/collectionInfoList&gt;</pre>		

## REST FRAMEWORK SERVICES

	<pre> &lt;collectionInfo     defaultJobJacketTicket="Default Job Ticket"     defaultJobJacketName="Default Job Jacket"     defaultJobJacketId="1"     templateId="0"     collectionClass="General"     collectionClassId="1416"     collectionTemplate="false"     accessibleChildrenAvailable="true"     domainId="0"     collectionPath="Home"     name="Home"     id="1"&gt;     &lt;attributeValueList&gt;         &lt;attributeValue valueId="0" type="numeric"         name="Id" id="1"&gt;1&lt;/attributeValue&gt;         &lt;attributeValue valueId="0" type="text"         name="Name" id="2"&gt;Home&lt;/attributeValue&gt;         ....     &lt;/attributeValueList&gt; &lt;/collectionInfo&gt; &lt;/parentColInfoList&gt; &lt;/collectionInfo&gt; &lt;/collectionInfoList&gt; </pre>

<b>Returns</b>	Returns a <code>collectionInfoList</code> object containing a list of collections assets.		
	<b>URL:</b> <code>http://serverName:serverPort/rest/service/collections/1?assets=true&amp;assetattributes=Name,collection</code> <b>Result:</b> <pre> &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfoList&gt;     &lt;collectionInfo         id="1"         name="Home"         collectionPath="Home"         domainId="19"         accessibleChildrenAvailable="true"         collectionTemplate="false"         collectionClassId="1416" </pre>		
<b>Examples</b>			

	<pre> collectionClass="General" templateId="0" defaultJobJacketId="1" defaultJobJacketName="Default Job Jacket" defaultJobJacketTicket="Default Job Ticket"&gt; &lt;attributeValueList&gt;     &lt;attributeValue id="1" name="Id" type="numeric"&gt;1&lt;/attributeValue&gt;     ..... &lt;/attributeValueList&gt; &lt;assetInfoList&gt;     &lt;assetInfo id="10"&gt;         &lt;attributeValueList&gt;             &lt;attributeValue id="2" name="Name" type="text"&gt; Workflows.json.txt &lt;/attributeValue&gt;             &lt;attributeValue id="55" name="Collection" type="popup" valueId="1" multiValued="false"&gt; Home         &lt;/attributeValue&gt;         &lt;attributeValueList&gt;         &lt;/attributeValue&gt;     &lt;/assetInfo&gt;     &lt;assetInfo id="11"&gt;         &lt;attributeValueList&gt;             &lt;attributeValue id="2" name="Name" type="text"&gt; Workflows.json.txt &lt;/attributeValue&gt;             &lt;attributeValue id="55" name="Collection" type="popup" valueId="1" multiValued="false"&gt; Home         &lt;/attributeValue&gt;         &lt;attributeValueList&gt;         &lt;/attributeValue&gt;     &lt;/assetInfo&gt; &lt;/assetInfoList&gt; &lt;/collectionInfo&gt; &lt;/collectionInfoList </pre>
--	---

<b>Function</b>	Get all collections in the hierarchy of the given collection along with assets and specific asset display attributes.		
<b>Description</b>	This request returns a complete collection hierarchy of the given collection along with collection assets with specific asset display attributes.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getCollection</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>hierarchy=[true]</code>	boolean	(Mandatory)
	<code>assets=[true]</code>	boolean	(Mandatory)
	<code>assetattributes</code>	long or string	An array of display attributes IDs or names to be used while querying for assets within a collection.
<b>Returns</b>	Returns a <code>collectionInfoList</code> object containing all collections in the hierarchy of a given collection along with assets specific metadata as specified in the <code>assetattributes</code> parameter.		
<b>Examples</b>	<b>URL:</b>		

	<pre>http://serverName:serverPort/rest/service/collections/1?hierarchy=true&amp; assets=true&amp;assetattributes=Name, collection</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfoList&gt;     &lt;collectionInfo id="1" name="Home" collectionPath="Home"&gt;         &lt;assetInfoList&gt;             &lt;assetInfo id="10"&gt;                 .....             &lt;/assetInfoList&gt;             &lt;collectionInfoList&gt;                 &lt;collectionInfo id="10" name="Demo" collectionPath="Home/Demo"&gt;                     &lt;assetInfoList&gt;                         &lt;assetInfo id="1"&gt;                             &lt;attributeValueList&gt;                                 &lt;attributeValue id="2" name="Name" type="text"&gt;Hydrangeas.PNG &lt;/attributeValue&gt;                                 &lt;attributeValue id="55" name="Collection" type="popup" valueId+'10' multivalued="false"&gt;Demo&lt;/attributeValue&gt;                             &lt;/attributeValueList&gt;                         &lt;/assetInfo&gt;                         &lt;assetInfo id="3"&gt;                             .....                         &lt;/assetInfoList&gt;                     &lt;/collectionInfo&gt;                 &lt;/collectionInfoList&gt;             &lt;/collectionInfo&gt;         &lt;/assetInfoList&gt;     &lt;/collectionInfo&gt; &lt;/collectionInfoList&gt;</pre>

## getCollectionHierarchy

<b>Function</b>	Get the metadata of each collection in the hierarchy.		
<b>Description</b>	This request returns all of the metadata associated with each collection in the hierarchy		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getCollectionHierarchy</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters Returns</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>hierarchy=[true false]</code>	boolean	Defaults to true. (Mandatory)
	<code>attributes=[attribute name or ID], [attribute name or ID],...</code>	string	To get a list of all attribute IDs, use a call to <code>.../admin/attributes</code> . (Optional)
	<code>workflows=[true false]</code>	boolean	Defaults to false. (Optional)
	<code>users=[true false]</code>	boolean	Defaults to false. (Optional)
	<code>groups=[true false]</code>	boolean	Defaults to false. (Optional)

	<code>routings=[true false]</code>	boolean	Defaults to <b>false</b> . (Optional)
	<code>revisioncontrols=[true false]</code>	boolean	Defaults to <b>false</b> . (Optional)
	<code>jobjackets=[true false]</code>	boolean	Defaults to <b>false</b> . (Optional)
	<code>contenttypes=[content type ID] or [content type name]</code>	string	<p>The default content type IDs are documented in the JavaDoc SDK at <code>com.quark.qpp.core.content.service.constants.DefaultContentTypes</code>. To get a list of content types, use a call to <code>.../admin/contenttypes</code>.(Optional)</p> <p>This parameter can be concatenated with above mentioned parameters workflows and revision controls.</p>
	Returns a <code>collectionInfoList</code> object with the metadata of each collection in the hierarchy.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/1?hierarchy=true</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;collectionInfoList&gt; &lt;collectionInfo defaultJobJacketTicket="Default Job Ticket" defaultJobJacketName="Default Job Jacket" defaultJobJacketId="1" templateId="0" collectionClass="General" collectionClassId="1416" collectionTemplate="false" accessibleChildrenAvailable="true" domainId="19" collectionPath="Home" name="Home" id="1"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="numeric" name="Id" id="1"&gt;1&lt;/attributeValue&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;Home&lt;/attributeValue&gt; .... &lt;/attributeValueList&gt; &lt;collectionInfo defaultJobJacketTicket="Default Job Ticket" defaultJobJacketName="Default Job Jacket" defaultJobJacketId="1" templateId="0" collectionClass="General" collectionClassId="1416" collectionTemplate="false" accessibleChildrenAvailable="true" domainId="19" collectionPath="Home/Collection" name="Collection" id="10"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="numeric" name="Id" id="1"&gt;10&lt;/attributeValue&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;Collection&lt;/attributeValue&gt; ..... &lt;/attributeValueList&gt; &lt;collectionInfo defaultJobJacketTicket="Default Job Ticket" defaultJobJacketName="Default Job Jacket" defaultJobJacketId="1" templateId="0" collectionClass="Book" collectionClassId="1403" collectionTemplate="false" accessibleChildrenAvailable="false" domainId="19" collectionPath="Home/Collection/123" name="123" id="14"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="numeric" name="Id" id="1"&gt;14&lt;/attributeValue&gt;</pre>		

	<pre>&lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;123&lt;/attributeValue&gt; . . . . . &lt;/attributeValueList&gt; &lt;/collectionInfo&gt; &lt;/collectionInfo&gt; &lt;/collectionInfo&gt; &lt;/collectionInfoList&gt;</pre>
--	--

**getCollectionDefaultJobJacket**

<b>Function</b>	Get the default Job Jackets file for a collection.		
<b>Description</b>	This request returns the default job jacket set for a collection. Returns null if no job jacket is specified as default for this collection or the content of the job jacket is not found.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getCollectionDefaultJobJacket</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=defaultjobjacket</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	Returns a <code>jobJacketInfo</code> object with its metadata.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/collections/1?op=defaultjobjacket</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;jobJacketInfo id="1"&gt; &lt;name&gt;Default Job Jacket&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;defaultTicketTemplate&gt;Default Job Ticket&lt;/defaultTicketTemplate&gt; &lt;createdBy&gt;1&lt;/createdBy&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;created&gt;2008-06- 01T10:00:00Z&lt;/created&gt; &lt;lastModifiedBy&gt;1&lt;/lastModifiedBy&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;lastModified&gt;2008- 06-01T10:00:00Z&lt;/lastModified&gt; &lt;ticketTemplateList&gt; &lt;ticketTemplate&gt;Default Job Ticket&lt;/ticketTemplate&gt; &lt;/ticketTemplateList&gt; &lt;content&gt; ... &lt;/content&gt; &lt;/jobJacketInfo&gt;</pre>		

**getCollectionDefaultTicket**

<b>Function</b>	Get the default Job Ticket for a collection.		
<b>Description</b>	This request returns the default Job Ticket for the collection.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getCollectionDefaultTicket</code>		<code>com.quark.qpp.service.facade</code>

	<code>Class CollectionFacade</code>		
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=defaultticket</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	Returns the name of the default job ticket for a collection.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/1?op=defaultticket</pre> <p><b>Result:</b></p> <p>Default Job Ticket. The name of the default job ticket for a collection.</p>		

### moveCollection

<b>Function</b>	Move a collection.		
<b>Description</b>	This request moves a collection or collection template from one level to another.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>moveCollection</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=move</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This request moves a collection along with its child collections and assets under a new parent collection.
	<code>targetparent=[collection path or ID]</code>	long or string	The collection to which this collection should be moved. (Mandatory)
<b>Returns</b>	Returns a <code>collectionInfo</code> object of the collection or the collection template with updated metadata.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/colTemplate ? op=move&amp;targetparent=Home/Collection/XDK</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfo templateId="0" collectionClass="General" collectionClassId="1416" collectionTemplate="true" accessibleChildrenAvailable="true" domainId="19" name="colTemplate" id="16"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="numeric" name="Id" id="1"&gt;1&lt;/attributeValue&gt; ... &lt;/attributeValueList&gt; &lt;workflowInfoList&gt; &lt;workflowInfo id="10"&gt; &lt;name&gt;Workflow1&lt;/name&gt; ... &lt;statusInfoList&gt; &lt;statusInfo</pre>		

	<pre>id="10"&gt; &lt;name&gt;Status1&lt;/name&gt; ... &lt;/statusInfo&gt; &lt;/statusInfoList&gt; &lt;/workflowInfo&gt; .... .... &lt;/collectionInfo&gt;</pre>
--	---

**duplicateCollection**

<b>Function</b>	Duplicate a collection.		
<b>Description</b>	This request duplicates a given collection or collection template.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>duplicateCollection</code>		<code>com.quark.qpp.service.facade</code> Class CollectionFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=copy</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>name=[new collection name]</code>	string	The name of the new collection. (Mandatory)
	<code>targetparent=[collection path or ID]</code>	long or string	The collection where the duplicate collection should be put. (Mandatory)There is a choice between collection ID, Name and Path when providing a value.
	<code>assets=[true or false]</code>	boolean	True to also duplicate assets. Defaults to <b>false</b> .(Optional)  If assets = <b>true</b> , then the metadata flags like <code>duplicateHierarchy</code> , <code>duplicateWorkflows</code> , <code>duplicateMembers</code> , etc will be overwritten as <b>true</b> .
	<code>createminorversion =[true false]</code>	boolean	This parameter will only work if <code>assets</code> parameter is given. Defaults to <b>false</b> .(Optional)
	<code>duphierarchy =[true false]</code>	boolean	Parameter to duplicate collection with or without its child collections. Defaults to <b>true</b> .(Optional)
	<code>dupworkflows =[true false]</code>	boolean	Parameter to duplicate collection with or without workflows. Defaults to <b>true</b> .(Optional)
	<code>dupmembers =[true false]</code>	boolean	Parameter to duplicate collection with or without users. Defaults to <b>true</b> .(Optional)
	<code>duproutings =[true false]</code>	boolean	Parameter to duplicate collection with or without Status Routing Settings.

			Defaults to <b>true</b> .(Optional)
	<code>dupjobjackets =[true false]</code>	boolean	Parameter to duplicate collection with or without JobJackets. Defaults to <b>true</b> .(Optional)
	<code>duprevisioncontrols =[true false]</code>	boolean	Parameter to duplicate collection with or without RevisionControl Settings. Defaults to <b>true</b> .(Optional)
<b>Returns</b>	Returns the <code>collectionInfo</code> object of the duplicated collection.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/24? op=duplicate&amp;name=dup12_Children&amp;targetparent=Home</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfo templateId="0" collectionClass="General" collectionClassId="1416" collectionTemplate="true" accessibleChildrenAvailable="true" domainId="19" name="dup12_Children" id="17"&gt; &lt;attributeValueList&gt;   &lt;attributeValue type="numeric" name="Id"   id="1"&gt;1&lt;/attributeValue&gt; ... &lt;/attributeValueList&gt;   &lt;workflowInfoList&gt; &lt;workflowInfo id="10"&gt;     &lt;name&gt;Workflow1&lt;/name&gt; ... &lt;statusInfoList&gt; &lt;statusInfo     id="10"&gt; &lt;name&gt;Status1&lt;/name&gt; ... &lt;/statusInfo&gt;   &lt;/statusInfoList&gt; &lt;/workflowInfo&gt; .... .... &lt;/collectionInfo&gt;</pre>		

## updateCollection

<b>Function</b>	Update a collection.		
<b>Description</b>	This request updates the metadata of a given collection or collection template.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateCollection</code>		<code>com.quark.qpp.service.facade</code> Class CollectionFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributevalues=&lt;xml/&gt;</code>	string	The set of attribute values. See "Request/Response parameter formats."(Mandatory)
	<code>workflows =[comma-separated list of workflow names or IDs]</code>	long or string	To update given collection's workflows. To get the IDs of all workflows, use a call to <code>.../admin/workflows</code> . (Optional)
	<code>groups=[group name or</code>	GroupInf	To update given collection's workflows.To

## REST FRAMEWORK SERVICES

	<code>ID], [group name or ID], ...</code>	oList	get the IDs of all groups, use a call to <code>.../admin/groups</code> . (Optional)
	<code>jobjackets =[comma-separated list of Job Jackets IDs]</code>	long or string	To update given collection's JobJackets. To get a list of Job Jackets and their IDs for a collection, use a call to <code>.../collections/colID?jobjackets=true</code> . (Optional)
	<code>routings=&lt;xml/&gt;</code>	xml	To update given collection's Status Routing Settings. See "Request/Response parameter formats."(Optional)
	<code>ticketname=[name of default Job Ticket]</code>	string	To update given collection's Default JobJacket Ticket Name. To get the name of Job Ticket for a collection, use a call to <code>.../collections/1?op=defaultticket</code> . (Optional)
	<code>applytochildren =[true false]</code>	boolean	Parameter to override settings on its child collection. Defaults to <b>false</b> . (Optional)  If this parameter is supplied, it will override the previous settings on its child collections. Used parameters ( e.g. Workflows) will not be removed in case the used workflow doesn't exist in the newly supplied parameters.
	<code>appendtochildren =[true false]</code>	boolean	Parameter to merge settings on its child collection. (Optional)Defaults to false. true is equivalent to Apply settings to child Collections: Merge in Platform. Supplied parameter settings will be merged to previous settings of its child collections.
	<code>users=&lt;xml/&gt;</code>	xml	To update given collection's Users. See "Request/Response parameter formats."(Optional)
	<code>revisioncontrols=&lt;xml /&gt;</code>	xml	To update given collection's Revision Control Settings. See "Request/Response parameter formats."(Optional)
Returns	Returns the <code>collectionInfo</code> object of the updated collection.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/13? op=update&amp;attributevalues=&lt;attributeValueList&gt;&lt;attributeValue name="name"&gt;dup_col&lt;/attributeValue&gt;&lt;/attributeValueList&gt; &amp;workflows=10&amp;users= &lt;userInfoList&gt;&lt;userInfo id="1"&gt;&lt;/userInfo&gt;&lt;/userInfoList&gt; &amp;groups=Group1</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfo templateId="0" collectionClass="General" collectionClassId="1416" collectionTemplate="true" accessibleChildrenAvailable="true" domainId="19"</pre>

```

## updateCollections

<b>Function</b>	Update multiple collections.		
<b>Description</b>	This request updates multiple collections in a single request.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateCollections</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)  This operation will run only for a valid session id.
	<code>collectioninfolist=&lt;xml&gt;</code>		See “Request/Response parameter formats.”
<b>Returns</b>	Returns a <code>collectioninfolist</code> object in XML format that contains the metadata of all successfully updated collections.		
<b>Examples</b>	<b>URL:</b> <code>https://serverName:serverPort/rest/service/collections?op=update&amp;collectioninfolist= &lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;collectionInfoList&gt; &lt;collectionInfo collectionClassId="1416" collectionTemplate="false" collectionPath="Home/Home3" &gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;Home3&lt;/attributeValue&gt; &lt;attributeValue valueId="0" type="dateTime" name="Created" id="3"&gt;2010-04-01T10:00:00Z&lt;/attributeValue&gt; &lt;attributeValue valueId="0" type="dateTime" name="Last modified" id="4"&gt;2010-04-01T10:00:00Z&lt;/attributeValue&gt; &lt;attributeValue valueId="1"</code>		

	<pre>         type="popup" name="Creator" id="5"&gt;Admin&lt;/attributeValue&gt;         &lt;attributeValue valueId="1" type="popup" name="Last modifier"         id="6"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue valueId="0"         type="boolean" name="Is Template"         id="59"&gt;false&lt;/attributeValue&gt; &lt;attributeValue valueId="0"         type="text" name="Collection Path"         id="57"&gt;Home/Home1&lt;/attributeValue&gt; &lt;attributeValue         valueId="1416" type="popup" name="Content Type"         id="62"&gt;General&lt;/attributeValue&gt; &lt;attributeValue valueId="0"         type="text" name="Content Type Hierarchy"         id="63"&gt;System;Collection;General&lt;/attributeValue&gt;         &lt;/attributeValueList&gt; &lt;/collectionInfo&gt; &lt;/collectionInfoList&gt;     </pre> <p><b>Result:</b></p> <pre>         &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;         &lt;collectionInfoList &gt; &lt;collectionInfo         defaultJobJacketTicket="Default Job Ticket"         defaultJobJacketName="Default Job Jacket"         defaultJobJacketId="1" templateId="0"         collectionClass="General" collectionClassId="1416"         collectionTemplate="false" accessibleChildrenAvailable="false"         domainId="19" collectionPath="Home/Home3" name="Home3"         id="23"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0"         type="numeric" name="Id" id="1"&gt;23&lt;/attributeValue&gt;         &lt;attributeValue valueId="0" type="text" name="Name"         id="2"&gt;Home3&lt;/attributeValue&gt; &lt;attributeValue valueId="0"         type="dateTime" name="Created" id="3"&gt;2014-04-         10T06:09:46Z&lt;/attributeValue &gt; .... &lt;/attributeValueList&gt;         &lt;workflowInfoList/&gt; &lt;routingInfoList/&gt; &lt;userInfoList&gt;         &lt;userInfo id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; .... &lt;/userInfo&gt;         &lt;/userInfoList&gt; &lt;groupInfoList/&gt; &lt;jobJacketInfoList &gt;         &lt;jobJacketInfo id="1"&gt; &lt;name&gt;Default Job Jacket&lt;/name&gt; ....         &lt;/jobJacketInfo&gt; &lt;/jobJacketInfoList&gt; &lt;/collectionInfo&gt;         &lt;collectionInfo&gt; ..... &lt;/collectionInfo&gt;         &lt;/collectionInfoList&gt;     </pre>
--	---

## deleteCollection

<b>Function</b>	Delete a collection.		
<b>Description</b>	This request deletes the specified collection or collection template.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>deleteCollection</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	string	<p>The op parameter allows you to specify which operation is to be performed. (Mandatory)</p> <p>This request works only for empty collections. This means a collection can only be deleted if the collection and all of its child collection do not have any assets in them.</p>

<b>Returns</b>	A status of 200 is returned in response to a successful request execution.
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/142?op=delete</pre>

### deleteCollectionWithAssets

<b>Function</b>	Delete a collection with assets.		
<b>Description</b>	This request deletes the given collection from the system along with its sub-collections and assets. Only users who have access to the given collection are allowed to delete the collection.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/[collection ID] or collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>deleteCollectionWithAssets</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=deletewithassets</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/142?op=deletewithassets</pre>		

### createJobjackets

<b>Function</b>	Create a Job Jackets file.		
<b>Description</b>	This request creates new job jacket after parsing the content supplied and returns and object of the newly created Job Jacket. Stream the Job Jackets XML into the request body or send it as a file part.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/jobjackets</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createJobjackets</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create:</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	Returns a <code>jobJacketInfoList</code> object in XML format.		

<b>Examples</b>  <b>Result:</b>  A <code>jobJacketInfoList</code> object in XML format.	<b>URL:</b>  <code>http://serverName:serverPort/rest/service/collections/jobjackets?op=create</code>
---	--

**getJobjacket**

<b>Function</b>	Get a Job Jackets file with a specific ID.	
<b>Description</b>	This request returns the specified job jacket.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../collections/jobjackets/[Job Jackets ID]</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getJobjacket</code>	<code>com.quark.qpp.service.facade.Class CollectionFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>jobJacketInfoList</code> object with its metadata.	
<b>Examples</b>	<b>URL:</b>  <code>http://serverName:serverPort/rest/service/collections/jobjackets/1</code>	
	<b>Result:</b>  <code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;jobJacketInfoList&gt; &lt;jobJacketInfo id="1"&gt; &lt;name&gt;Default Job Jacket&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;defaultTicketTemplate&gt;Default Job Ticket&lt;/defaultTicketTemplate&gt; &lt;createdBy&gt;1&lt;/createdBy&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;created&gt;2008-06-01T10:00:00Z&lt;/created&gt; &lt;lastModifiedBy&gt;1&lt;/lastModifiedBy&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;lastModified&gt;2008-06-01T10:00:00Z&lt;/lastModified&gt; &lt;ticketTemplateList&gt; &lt;ticketTemplate&gt;Default Job Ticket&lt;/ticketTemplate&gt; &lt;/ticketTemplateList&gt; &lt;content&gt;.... &lt;/content&gt; &lt;/jobJacketInfo&gt; &lt;/jobJacketInfoList&gt;</code>	

**getAllJobJackets**

<b>Function</b>	Get all Job Jackets.	
<b>Description</b>	This request returns all the metadata of Job Jackets available in the system.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../collections/jobjackets</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllJobJackets</code>	<code>com.quark.qpp.service.facade.Class CollectionFacade</code>
<b>Parameters</b>	This request requires no input parameters.	

<b>Returns</b>	Returns a <code>jobJacketInfoList</code> object that contains a list of Job Jackets.
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/jobjackets</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;jobJacketInfoList&gt; &lt;jobJacketInfo id="1"&gt; &lt;name&gt;Default Job Jacket&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;defaultTicketTemplate&gt;Default Job Ticket&lt;/defaultTicketTemplate&gt; &lt;createdBy&gt;1&lt;/createdBy&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;created&gt;2008-06- 01T10:00:00Z&lt;/created&gt; &lt;lastModifiedBy&gt;1&lt;/lastModifiedBy&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;lastModified&gt;2008- 06-01T10:00:00Z&lt;/lastModified&gt; &lt;ticketTemplateList&gt; &lt;ticketTemplate&gt;Default Job Ticket&lt;/ticketTemplate&gt; &lt;/ticketTemplateList&gt; &lt;content&gt;.....&lt;/content&gt; &lt;/jobJacketInfo&gt; ..... &lt;/jobJacketInfoList&gt;</pre>

### getJobJacketContent

<b>Function</b>	Get the contents of a Job Jackets file.		
<b>Description</b>	This request returns the actual content of a specified job jacket in xml format.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../collections/[collection ID]</code> or <code>collectionsbypath/[collection path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getJobJacketContent</code>		<code>com.quark.qpp.service.facade</code> Class CollectionFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=jobjacketcontent</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	To get a list of Job Jackets and their IDs for a collection, use a call to <code>.../collections/colID?jobjackets=true</code> . (Mandatory)		
	Returns the actual content of a specified job jacket in XML format		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/1?op=jobjacketcontent&amp;jobjacket=1</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;JDF xmlns="http://www.CIP4.org/JDFSchema_1_1" xmlns:qxp="http://www.quark.com/QuarkXPress/JDF_1" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" Version="1.2" JacketVersion="1.0" ID="QuarkXPressDefault_Job_Jacket" Type="QuarkXPressJacket" xsi:type="qxp:QuarkXPressJacket" Status="Waiting" Name="Default Job Jacket" Template="true"&gt; &lt;ResourcePool&gt;</pre>		

	<pre>&lt;/ResourcePool&gt; &lt;JDF Name="Default Job Ticket" ID="JobTicket_0" IsDefault="1" Status="Waiting" Template="true" Type="QuarkXPressTemplateTicket" xsi:type="qxp:QuarkXPressTemplateTicket"&gt; &lt;ResourceLinkPool&gt; &lt;/ResourceLinkPool&gt; &lt;ResourcePool&gt; &lt;/ResourcePool&gt; &lt;/JDF&gt; &lt;/JDF&gt;</pre>
--	--

**updateJobJacket**

<b>Function</b>	Update a job jacket.		
<b>Description</b>	This request updates the contents of a specified job jacket.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/jobjackets/{jobJacketId}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateJobJacket</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation will run only for a valid session id. Pass the xml of the job jacket file as file stream in the request body.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/collections/jobjackets/{jobJacketId}</code> <code>?op=update</code>		

**updateJobJackets**

<b>Function</b>	Update multiple job jackets		
<b>Description</b>	This request updates the contents of multiple job jackets in a single request.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/jobjackets</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateJobJackets</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)  This operation will run only for a valid session id.
	<code>jobjacketinfolist=&lt;xm</code>		See "Request/Response parameter"

	1/>		formats."
Returns	Returns a <code>jobjacketinfolist</code> object in XML format that contains the metadata of all successfully updated job jackets.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/collections/jobjackets?op=update&amp;jobjacketinfolist=&lt;xml /&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;jobJacketInfoList&gt; &lt;jobJacketInfo id="1"&gt; &lt;name&gt;Default Job Jacket&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;defaultTicketTemplate&gt;Default Job Ticket&lt;/defaultTicketTemplate&gt; &lt;createdBy&gt;1&lt;/createdBy&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;created&gt;2008-06-01T10:00:00Z&lt;/created&gt; &lt;lastModifiedBy&gt;1&lt;/lastModifiedBy&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;lastModified&gt;2008-06-01T10:00:00Z&lt;/lastModified&gt; &lt;ticketTemplateList&gt; &lt;ticketTemplate&gt;Default Job Ticket&lt;/ticketTemplate&gt; &lt;/ticketTemplateList&gt; &lt;content&gt;&lt;?xml version="1.0" encoding="UTF-8"?&gt;&lt;JDF xmlns="http://www.CIP4.org/JDFSchema_1_1" xmlns:qxp="http://www.quark.com/QuarkXPress/JDF_1" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" Version="1.2" JacketVersion="1.0" ID="QuarkXPressDefault_Job_Jacket" Type="QuarkXPressJacket" xsi:type="qxp:QuarkXPressJacket" Status="Waiting" Name="Default Job Jacket" Template="true"&gt; &lt;ResourcePool&gt;&lt;/ResourcePool&gt; &lt;JDF Name="Default Job Ticket" ID="JobTicket_0" IsDefault="1" Status="Waiting" Template="true" Type="QuarkXPressTemplateTicket" xsi:type="qxp:QuarkXPressTemplateTicket"&gt; &lt;ResourceLinkPool&gt;&lt;/ResourceLinkPool&gt; &lt;ResourcePool&gt;&lt;/ResourcePool&gt; &lt;/JDF&gt;&lt;/JDF&gt; &lt;/content&gt; &lt;/jobJacketInfo&gt; &lt;/jobJacketInfoList&gt;</pre>		

### parseJobJacketXml

Function	Parse a Job Jackets file. (Include the file in the request body or as file part.)		
Description	This request parses the jobjacket xml and returns a JobJacket object containing the jobjacket name and ticket names.		
Type	POST		
URL Format	.../collections/jobjackets		
Java API	Method Name		Class Name
	<code>parseJobJacketXml</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
Parameters	Name	Type	Description
	<code>op=parsexml</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	Returns a <code>jobjacketinfo</code> object in XML format.		
Examples	<p><b>URL:</b></p>		

## REST FRAMEWORK SERVICES

	<pre>http://serverName:serverPort/rest/service/collections/jobjackets? op=parsexml</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;jobJacketInfo id="0"&gt; &lt;name&gt;Project1 Job Jacket&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;defaultTicketTemplate&gt;Default Job Ticket&lt;/defaultTicketTemplate&gt; &lt;createdBy&gt;0&lt;/createdBy&gt; &lt;lastModifiedBy&gt;0&lt;/lastModifiedBy&gt; &lt;ticketTemplateList&gt; &lt;ticketTemplate&gt;Default Job Ticket&lt;/ticketTemplate&gt; &lt;/ticketTemplateList&gt; &lt;/jobJacketInfo&gt;</pre>
--	--

### deleteJobJacket

<b>Function</b>	Delete a Job Jackets file.		
<b>Description</b>	This request deletes the jobjacket with the given id.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/jobjackets/ [Job Jacket ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>deleteJobJacket</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/collections/jobjackets/10?op=delete</code>		

### getApplicableRoutingUsers

<b>Function</b>	Get Applicable Routing Users		
<b>Description</b>	This request returns a list of applicable routing users for the given collection for specified workflow and status. This will return all collection mapped users having the same userclass as any of the status mapped userclasses.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../collections/{collectionId}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getApplicableRoutingUsers</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>routingusers =true</code>	boolean	
	<code>workflow={workflowIdOrName}</code>	string	The ID or Name of the workflow whose Routing Users you wish to be retrieved.

	<code>status={statusIdOrName} e} or workflowStatusCombination</code>	string	The ID or Name of the status whose Routing Users you wish to be retrieved.
Returns	Returns an <code>userInfoList</code> object containing a list of all collection users applicable for given workflow or status.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/collections/ 1?routingusers=true&amp;status=Status1</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;userInfoList&gt; &lt;userInfo id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;firstName&gt;Administrator&lt;/firstName&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;true&lt;/enabled&gt; &lt;defaultUserClassId&gt;1&lt;/defaultUserClassId&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; .... &lt;/userInfoList&gt;</pre>		

## getApplicablePrivileges

Function	Get applicable privileges for the logged in user.		
Description	This request returns the privileges applicable for the logged in user for the given collection. These privileges are a union of the privileges of the following user classes: Userclass of the logged in user in the given collection, only if the user is mapped to the given collection. Userclasses of collection mapped groups of which the logged in user is a member.		
Type	GET		
URL Format	<code>.../collections/[collection ID]</code>		
Java API	<b>Method Name</b> <code>getApplicablePrivileges</code>	<b>Class Name</b> <code>com.quark.qpp.service.facade Class CollectionFacade</code>	
Parameters	<b>Name</b> <code>applicableprivileges=[true]</code>	<b>Type</b> <code>boolean</code>	<b>Description</b> 
	<code>status=[statusId] or [Name] or [StatusWorkFlowCombination]</code>	<code>long</code>	The ID or Name of the status whose privileges you wish to be retrieved.
	<code>contenttype=[contentType] [path] or [Name] or [Path]</code>	<code>long</code>	The default content type IDs are documented in the JavaDoc SDK at <code>com.quark.qpp.core. content.service.constants.Default ContentTypes</code> . To get a list of content types, use a call to <code>.../admin/contenttypes</code> . (Optional)

## REST FRAMEWORK SERVICES

			If not provided, the metadata of all content types will be returned.
	<code>privileges=[comma-separated list of privilege ids or names]</code>	string	
Returns	Returns a <code>applicablePrivilegesInfo</code> object containing either application and content level privileges or both, depending upon the parameters.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/collections/192?applicableprivileges=true</code></p> <p><b>Result:</b></p> <pre>&lt;applicablePrivilegesInfo&gt; &lt;applicationPrivList&gt; &lt;privilege id="140000023"&gt; &lt;name&gt;Delete&lt;/name&gt; &lt;privilegeHierarchy&gt; Administration;Storage;StorageRules;Delete &lt;/privilegeHierarchy&gt; &lt;/privilege&gt; &lt;privilege id="140000022"&gt; &lt;name&gt;Create/Modify&lt;/name&gt; &lt;privilegeHierarchy&gt; Administration;Storage;StorageRules;Create/Modify &lt;/privilegeHierarchy&gt; &lt;/privilege&gt; ..... &lt;/applicationPrivList&gt; &lt;contentTypePrivList&gt; &lt;contentTypePriv contentTypeId="1100" contentType="Asset" contentTypeHierarchy="System;Asset;"&gt; &lt;privilege id="3000006"&gt; &lt;name&gt;Change Workflow of Checked In Asset&lt;/name&gt; &lt;privilegeHierarchy&gt; Edit Attributes;Change Workflow of Checked In Asset &lt;/privilegeHierarchy&gt; &lt;/privilege&gt; ..... &lt;/contentTypePriv&gt; &lt;/contentTypePrivList&gt; &lt;/applicablePrivilegesInfo&gt;</pre>		

Function	Get enabled content type privileges.		
Description	This request returns only contenttype based privileges applicable for the logged in user for the given collection. These privileges are a union of the privileges of the following user classes: Userclass of the logged in user in the given collection, only if the user is mapped to the given collection. Userclasses of collection mapped groups of which the logged in user is a member.		
Type	GET		
URL Format	<code>.../collections/[collection ID]</code>		
Java API	<b>Method Name</b>	<b>Class Name</b>	
	<code>getApplicablePrivileges</code>	<code>com.quark.qpp.service.facade.CollectionFacade</code>	
Parameters	<b>Name</b> <code>applicableprivileges=[true]</code>	<b>Type</b> boolean	<b>Description</b> (Mandatory)
	<code>contenttype=[contentType]</code> <code>peId] or [Name] or [Path]</code>	long	The default content type IDs are documented in the JavaDoc SDK at <code>com.quark.qpp.core.content.service.constants.DefaultContentTypes</code> . To get a list of content types, use a call to <code>.../admin/contenttypes</code> . (Optional)

		If not provided, the metadata of all content types will be returned.
Returns	Returns a <code>applicablePrivilegesInfo</code> object containing either application and content level privileges or both, depending upon the parameters.	
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/192 ?applicableprivileges=true&amp;contenttype=Picture</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;applicablePrivilegesInfo&gt; &lt;contentTypePrivList&gt; &lt;contentTypePriv contentTypeId="1103" contentType="Picture" contentTypeHierarchy="System;Asset;Picture;"&gt; &lt;privilege id="10000015"&gt; &lt;name&gt;Get Original Assets&lt;/name&gt; &lt;privilegeHierarchy&gt;General;Get Original Assets&lt;/privilegeHierarchy&gt; &lt;/privilege&gt; &lt;privilege id="10000012"&gt; &lt;name&gt;Check In Asset without Displaying the Check In Dialog Box&lt;/name&gt; &lt;privilegeHierarchy&gt; General;Check In Asset without Displaying the Check In Dialog Box &lt;/privilegeHierarchy&gt; &lt;/privilege&gt; ....</pre>	

Function	Get all enabled status privileges.						
Description	This request returns the privileges applicable for the logged in user for the given collection and status (Status based overridden privileges) . These privileges are a union of the privileges of the following user classes: Userclass of the logged in user in the given collection, only if the user is mapped to the given collection. Userclasses of collection mapped groups of which the logged in user is a member.						
Type	GET						
URL Format	<code>.../collections/[collection ID]</code>						
Java API	<table border="1"> <tr> <th>Method Name</th> <th>Class Name</th> </tr> <tr> <td><code>getApplicablePrivileges</code></td> <td><code>com.quark.qpp.service.facade</code> Class CollectionFacade</td> </tr> </table>			Method Name	Class Name	<code>getApplicablePrivileges</code>	<code>com.quark.qpp.service.facade</code> Class CollectionFacade
Method Name	Class Name						
<code>getApplicablePrivileges</code>	<code>com.quark.qpp.service.facade</code> Class CollectionFacade						
Parameters	Name	Type	Description				
	<code>applicableprivileges=[true]</code>	boolean					
	<code>status=[statusId] or [Name] or [StatusWorkflowCombination]</code>	boolean	The ID or Name of the status whose privileges you wish to be retrieved.				
	<code>privileges=[comma-separated list of privilege ids or names]</code>	long or string					
Returns	Returns a <code>applicablePrivilegesInfo</code> object containing either application and content level privileges or both, depending upon the parameters.						
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/192</pre>						

	?applicableprivileges=true&status=10&privileges=...,...,...
	<p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;applicablePrivilegesInfo&gt; &lt;contentTypePrivList&gt; &lt;contentTypePriv contentTypeId="1103" contentType="Picture" contentTypeHierarchy="System;Asset;Picture;"&gt; &lt;privilege id="10000015"&gt; &lt;name&gt;Get Original Assets&lt;/name&gt; &lt;privilegeHierarchy&gt;General;Get Original Assets&lt;/privilegeHierarchy&gt; &lt;/privilege&gt; &lt;privilege id="10000012"&gt; &lt;name&gt;Check In Asset without Displaying the Check In Dialog Box&lt;/name&gt; &lt;privilegeHierarchy&gt; General;Check In Asset without Displaying the Check In Dialog Box &lt;/privilegeHierarchy&gt; &lt;/privilege&gt; .....</pre>

### getApplicableRoutingGroups

<b>Function</b>	Get applicable routing groups for the logged in user.	
<b>Description</b>	This request returns an array of applicable routings groups for the given collection for the specified workflow and status. This will return all collection mapped groups whose userclass is the same as one of the status mapped userclasses.	
<b>Type</b>	GET	
<b>URL Format</b>	.../collections/[collection ID]	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	getApplicableRoutingGroups	com.quark.qpp.service.facade Class CollectionFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>
	routinggroups=[true]	boolean
	workflow=[Id] or [Name]	long or string
	status=[statusId] or [Name] or [StatusWorkFlowCombin ation]	long or string
<b>Returns</b>	Returns a list of applicable routing <code>GroupInfo</code> objects for the given collection and status.	
<b>Examples</b>	<b>URL:</b> <pre>http://serverName:serverPort/rest/service/collections/1 ?routinggroups=true&amp;workflow=Default Workflow&amp;status&gt;Edit</pre>	
	<b>Result:</b> <pre>&lt;groupInfoList&gt; &lt;groupInfo id="60"&gt; &lt;name&gt;Editors&lt;/name&gt; &lt;emailAddress/&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;1&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Administrator&lt;/defaultUserClass&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre>	

**getApplicableAttributeConstraints**

<b>Function</b>	Get applicable attribute constraints for the logged in user.		
<b>Description</b>	This request returns attribute constraints applicable to the given status and collection for the logged in user. The user may have multiple userclasses, due to its membership in multiple groups which are mapped to the collection with different userclasses. Since attribute constraints are defined per userclass, multiple constraints in such cases are evaluated and the most permissive set of attribute constraints is returned.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../collections/[collection ID]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getApplicableAttributeConstraints</code>		<code>com.quark.qpp.service.facade</code> <code>Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>applicableconstraints=[true]</code>	boolean	
	<code>status=[statusId] or [Name] or [StatusWorkFlowCombination]</code>	long or string	The ID or Name of the status whose attributes constraints you wish to be retrieved.
<b>Returns</b>	<code>attributes=[comma-separated list of attributes ids or names]</code>	long or string	
	Returns a list of applicable <code>AttributeConstraintsInfo</code> objects.		
	<b>URL:</b> <code>http://serverName:serverPort/rest/service/collections/191</code> <code>?applicableconstraints=true&amp;status=Default</code> <code>Workflow&amp;attributes=2,...,....</code>		
<b>Examples</b>	<b>Result:</b> <code>&lt;attributeConstraintsInfoList&gt; &lt;attributeConstraintsInfo&gt;</code> <code>&lt;attributeId&gt;2&lt;/attributeId&gt;</code> <code>&lt;attributeName&gt;Name&lt;/attributeName&gt;</code> <code>&lt;constraintId&gt;1&lt;/constraintId&gt; &lt;constraintName&gt;PREVENT</code> <code>CHANGE&lt;/constraintName&gt; &lt;/attributeConstraintsInfo&gt; .....</code> <code>&lt;/attributeConstraintsInfoList&gt;</code>		

**getApplicableStatusTransition**

<b>Function</b>	Get applicable status transitions for the logged in user.
<b>Description</b>	This request returns the applicable status transition for the given workflow, status and collection for the logged in user. If the status transition is overridden for the given userclass, then overridden will be considered.
<b>Type</b>	GET
<b>URL Format</b>	<code>.../collections/[collection ID]</code>

## REST FRAMEWORK SERVICES

<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	getApplicableStatusTransition		com.quark.qpp.service.facade Class CollectionFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	statusTransitions=[true]	boolean	
	workflow=[workflowId] or [Name]	long or string	The ID or Name of the workflow whose status transitions you wish to be retrieved.
<b>Returns</b>	Returns a <code>statusTransitionInfoList</code> object containing a list of applicable status transitions.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/1 ?statusTransitions=true&amp;workflow=Default Workflow</pre> <p><b>Result:</b></p> <pre>&lt;statusTransitionInfoList&gt; &lt;statusTransitionInfo id="10"&gt; &lt;name&gt;Edit&lt;/name&gt; &lt;workflowInitiatingStatus&gt;true&lt;/workflowInitiatingStatus&gt; &lt;nextPossibleStatusInfoList&gt; &lt;nextPossibleStatusInfo id="11"&gt; &lt;name&gt;Publish&lt;/name&gt; &lt;/nextPossibleStatusInfo&gt; &lt;/nextPossibleStatusInfoList&gt; &lt;/statusTransitionInfo&gt; &lt;statusTransitionInfo id="11"&gt; &lt;name&gt;Publish&lt;/name&gt; &lt;workflowInitiatingStatus&gt;true&lt;/workflowInitiatingStatus&gt; &lt;nextPossibleStatusInfoList&gt; &lt;nextPossibleStatusInfo id="10"&gt; &lt;name&gt;Edit&lt;/name&gt; &lt;/nextPossibleStatusInfo&gt; &lt;/nextPossibleStatusInfoList&gt; &lt;/statusTransitionInfo&gt; &lt;/statusTransitionInfoList&gt;</pre>		

### getApplicableWorkflowInitialStatuses

<b>Function</b>	Get applicable workflow initial statuses.		
<b>Description</b>	This request returns the initial applicable statuses for the given workflow and collection.		
<b>Type</b>	GET		
<b>URL Format</b>	.../collections/[collection ID]		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	getApplicableWorkflowInitialStatuses		com.quark.qpp.service.facade Class CollectionFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	workflowInitiatingStatuses=[true]	boolean	
	workflow=[workflowId] or [Name]	long or string	The ID or Name of the workflow whose workflow Initiating Statuses you wish to be retrieved.
<b>Returns</b>	Returns a list of <code>StatusInfo</code> objects referring to the initial applicable statuses.		

<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/collections/1 ?workflowinitiatingstatuses=true&amp;workflow=Default Workflow</pre> <p><b>Result:</b></p> <pre>&lt;statusInfoList&gt; &lt;statusInfo id="10"&gt; &lt;name&gt;Edit&lt;/name&gt; ..... &lt;/statusInfo&gt; &lt;statusInfo id="11"&gt; &lt;name&gt;Publish&lt;/name&gt; ..... &lt;/statusInfo&gt; &lt;/statusInfoList&gt;</pre>
-----------------	---

## Query management

The query management capabilities of the API allow application developers to manage searches and includes the following REST calls:

- [\*search\*](#)
- [\*searchAssets\*](#)
- [\*searchCollections\*](#)
- [\*createSearches\*](#)
- [\*getSearch\*](#)
- [\*getAllSearches\*](#)
- [\*getSearchResultsForQuery\*](#)
- [\*getTextSearchResults\*](#)
- [\*setSharedSearchTrustees\*](#)
- [\*getSharedSearchTrustees\*](#)
- [\*updateSearches\*](#)
- [\*deleteSearch\*](#)
- [\*count\*](#)
- [\*countAssets\*](#)
- [\*countCollections\*](#)
- [\*countSearchResultsForQuery\*](#)
- [\*countTextResults\*](#)

### search

<b>Function</b>	Search assets/collection using a searchDefinition.	
<b>Description</b>	This request searches assets/collections based on a given searchDefinition.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../search</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>

## REST FRAMEWORK SERVICES

	search		com.quark.qpp.service.facade Class QueryFacade
Parameters	Name	Type	Description
	searchinfo=[xml]	string	An XML object containing metadata of the asset/collections to be found.
Returns	Returns a <code>assetInfolist</code> object containing the metadata of the asset to be found , if the context of the given searchInfo is ASSET. Returns a <code>collectionInfolist</code> object containing the metadata of the asset to be found , if the context of the given searchInfo is COLLECTION.		
Examples	<b>URL:</b> <code>http://serverName:serverPort/rest/service/search?search=&lt;xml/&gt;</code> <b>Result:</b> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfoList&gt; &lt;assetInfo id="66"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text"&gt;name="Name" id="2"&gt;Alberi.jpg&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;assetInfo id="72"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text"&gt;name="Name"&gt;id="2"&gt;QuarkImage.jpg&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>		

### searchAssets

Function	Search assets for a particular attribute value.		
Description	This request searches for assets matching specific search criteria.		
Type	GET		
URL Format	<code>.../search/assets</code>		
	<b>Method Name</b> <code>searchAssets</code>		<b>Class Name</b> <code>com.quark.qpp.service.facade Class QueryFacade</code>
Parameters	<b>Name</b> <code>[attribute name or id]=[attribute value]</code>	<b>Type</b> long or string	<b>Description</b> The attribute name and value that you are searching for. (Mandatory) The attributes must be queryable. The following is a list of non-queryable attributes: <ul style="list-style-type: none"> <li>• Article Component id</li> <li>• Article Component Reference Asset Id</li> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor version</li> </ul>

			<ul style="list-style-type: none"> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> <li>• Attachment Checksum</li> <li>• Auxillary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> <li>• Page Index</li> <li>• Page NameRelationship Status</li> <li>• Status</li> <li>• XPath</li> </ul> <p>Functions to get assets based on two non-queryable attributes (<b>Collection</b>, <b>Status</b>) are given below.</p> <p>You can pass more than one attribute as a parameter with the value to search for.</p>
	<code>includechildcontenttypes = [true false]</code>	boolean	Parameter to include child content types in search criteria.
	<code>attributes =[comma-separated list of attribute names or IDs]</code>		You can pass the appropriate value for any queryable attribute. For a list of attributes, use a call to <code>..admin/attributes</code> .
	<code>displaymode=[x]</code>	long	The default display modes are documented in the JavaDoc SDK at <code>com.quark.qpp.core.query.service.constants.DefaultDisplayModes</code> . (Optional) Defaults to 1.
	<code>exploremode=[x]</code>	long	For a list of explore modes, see <code>ExploreModeTypes.java</code> . (Optional) Defaults to 0.

## REST FRAMEWORK SERVICES

	<code>collections</code>	string	Comma separated ids of collections in which assets are to be searched.
	<code>recursive=[true false]</code>	boolean	Indicates whether all of the hierarchy below and including collections are to be searched. Default value= <b>true</b>
<b>Returns</b>	Returns search results based upon specified attribute values.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/search/assets? Name=1quark2.jpg&amp;Collection=Home</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfoList&gt; &lt;assetInfo id="4"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="popup" name="Workflow" id="54"&gt;Workflow1&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Collection" id="55"&gt;Home&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Routed to" id="25"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Status" id="24"&gt;Status1&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Content Type" id="62"&gt;Picture&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>		

<b>Function</b>	Search for assets that contain a particular text string.		
<b>Description</b>	This request will search for assets that contain a given text string. This is specific to content based searches in workspace and ConnectClient.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../search/assets</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>searchAssets</code>	<code>com.quark.qpp.service.facade.QueryFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>text=[text to search for]</code>	string	Specify the string to search for. (Mandatory)
			You can pass the appropriate value for any queryable attribute to fetch specific attributes.  For a list of attributes, use a call to <code>...admin/attributes</code> .  The attributes must be queryable.  The following is a list of non-queryable attributes: <ul style="list-style-type: none"><li>• Article Component id</li><li>• Article Component Reference Asset Id</li><li>• </li></ul>

			<ul style="list-style-type: none"> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor version</li> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> <li>• Attachment Checksum</li> <li>• Auxillary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> <li>• Page Index</li> <li>• Page Name</li> <li>• Relationship Status</li> <li>• Status</li> <li>• XPath</li> </ul>
<b>Returns</b>	Returns an <code>assetInfoList</code> object containing the assets that contain the specified text string.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/search/assets?text=box&amp;attributes=Name</pre> <p><b>Result:</b></p> <pre>Example of a text search with specific attribute:&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfoList&gt; &lt;assetInfo id="292"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;15116462.qxp&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;assetInfo id="304"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;15116c9a.qxp&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;assetInfo id="306"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text" name="Name"</pre>		

## REST FRAMEWORK SERVICES

	<pre>id="2"&gt;15116d33.qxp&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>		
<b>Function</b>	Search for a particular attachment.		
<b>Description</b>	This request searches for all attachments for a given document.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../search/assets</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>searchAssets</code>		<code>com.quark.qpp.service.facade</code> <code>Class QueryFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>document=[ID of the project]</code>	long	<p>ID of the document whose attachments you want found. (Mandatory)</p> <p>You can pass the appropriate value for any queryable attribute to fetch specific attributes.</p> <p>For a list of attributes, use a call to <code>..admin/attributes</code>.</p> <p>The attributes must be queryable.</p> <p>The following is a list of non-queryable attributes:</p> <ul style="list-style-type: none"> <li>• Article Component id</li> <li>• Article Component Reference Asset Id</li> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor version</li> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> <li>• Attachment Checksum</li> <li>• Auxillary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> </ul>

			<ul style="list-style-type: none"> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> <li>• Page Index</li> <li>• Page Name</li> <li>• Relationship Status</li> <li>• Status</li> <li>• XPath</li> </ul>
<b>Returns</b>	Returns an <code>assetInfoList</code> object containing the assets that contain child assets.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/search/assets?document=22</code></p> <p><b>Result:</b>  A <code>QueryResultInfo</code> object in XML format.</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfoList&gt; &lt;assetInfo id="290"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;153486e3.qcd&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>		

<b>Function</b>	Search within an existing query.		
<b>Description</b>	This request searches an existing query in the platform.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../search/assets</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>searchAssets</code>	<code>com.quark.qpp.service.facade</code> <code>Class QueryFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>query=[ID of the query]</code>	long or string	Use /search to get IDs. (Mandatory)
			You can pass the appropriate value for any queryable attribute to fetch specific attributes.  For a list of attributes, use a call to <code>...admin/attributes</code> .  The attributes must be queryable.  The following is a list of non-queryable attributes: <ul style="list-style-type: none"><li>• Article Component id</li></ul>

## REST FRAMEWORK SERVICES

			<ul style="list-style-type: none"> <li>• Article Component Reference Asset Id</li> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor Version</li> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> <li>• Attachment Checksum</li> <li>• Auxillary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> <li>• Page Index</li> <li>• Page Name</li> <li>• Relationship Status</li> <li>• Status</li> <li>• XPath</li> </ul>
Returns	Returns a <code>QueryResultInfo</code> object in XML format.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/search/assets?query=12</code></p> <p><b>Result:</b>  A <code>QueryResultInfo</code> object in XML format.</p>		

Function	Search for assets with a particular status.
Description	This request returns all assets associated with given status.
Type	GET
URL Format	<code>.../search/assets</code>

Java API	Method Name		Class Name
	searchAssets		com.quark.qpp.service.facade Class QueryFacade
Parameters	Name	Type	Description
	<p><code>status=[status name]</code>  <code>and workflow=[workflow name]</code></p>	string	<p>Specify Status of a workflow. Specify Name or ID of a workflow. (Mandatory)</p> <p>Status and workflow will go hand in hand.</p>
	<p><code>attributes=[comma-separated list of attribute names or IDs]</code></p>	long or string	<p>You can pass the appropriate value for any queryable attribute to fetch specific attributes.</p> <p>For a list of attributes, use a call to <code>..admin/attributes</code>.</p> <p>The attributes must be queryable.</p> <p>The following is a list of non-queryable attributes:</p> <ul style="list-style-type: none"> <li>• Article Component id</li> <li>• Article Component Reference Asset Id</li> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor Version</li> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> <li>• Attachment ChecksumAuxillary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> </ul>

## REST FRAMEWORK SERVICES

			<ul style="list-style-type: none"> <li>• Page Index</li> <li>• Page Name</li> <li>• Relationship Status</li> <li>• Status</li> <li>• XPath</li> </ul>
Returns	Returns an <code>assetInfoList</code> object containing an array of assets related to a given status.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/search/assets?workflow=Workflow1 &amp;status=Status1&amp;attributes=name,5,7,62,54,collection</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfoList&gt; &lt;assetInfo id="4"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;1quark2.jpg&lt;/attributeValue&gt; ... &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;assetInfo id="10"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;Tulips&lt;/attributeValue&gt; ... &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>		

Function	Search for assets in a particular collection.		
Description	This request searches for the assets checked-in at given collection.		
Type	GET		
URL Format	<code>.../search/assets</code>		
Java API	Method Name		Class Name
	<code>searchAssets</code>		<code>com.quark.qpp.service.facade</code> <code>Class QueryFacade</code>
Parameters	Name	Type	Description
	<code>collections =[comma-separated list of collection names or IDs]</code>	long or string	To get a list of collection IDs for a particular collection, use a call to <code>...collectionsbypath/ [path].(Mandatory)</code>
	<code>recursive=[true false]</code>	boolean	Parameter to include child collections. Defaults to <b>true</b> . (Optional)
	<code>attributes=[comma-separated list of attribute names or IDs]</code>	long or string	You can pass the appropriate value for any queryable attribute to fetch specific attributes.  For a list of attributes, use a call to <code>...admin/attributes</code> .  The attributes must be queryable.  The following is a list of non-queryable attributes: <ul style="list-style-type: none"><li>• Article Component id</li></ul>

			<ul style="list-style-type: none"> <li>• Article Component Reference Asset Id</li> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor Version</li> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> <li>• Attachment ChecksumAuxillary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> <li>• Page Index</li> <li>• Page Name</li> <li>• Relationship Status</li> <li>• Status</li> <li>• XPath</li> </ul>
<b>Returns</b>	Returns an <code>assetInfoList</code> object containing an array of assets checked-in at a specified collection.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/search/assets?collections=Home &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;</pre> <p><b>Result:</b></p> <pre>&lt;assetInfoList&gt; &lt;assetInfo id="4"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;1quark2.jpg&lt;/attributeValue&gt; ... &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;assetInfo id="10"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;Tulips&lt;/attributeValue&gt; ... &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>		

**searchCollections**

<b>Function</b>	Search for collections in a particular collection.		
<b>Description</b>	This request searches all nested collections accessible to the user under a given collection ID or Name.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../search/collections</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>searchCollections</code>		<code>com.quark.qpp.service.facade</code> <code>Class QueryFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>collections =[comma-separated list of collection names or IDs]</code>	long or string	Parameter to include child collections. To get a list of collection IDs for a particular collection, use a call to <code>...collectionsbypath/ [path].(Mandatory)</code>
	<code>recursive=[true false ]</code>	boolean	Defaults to <b>true</b> .(Optional)
	<code>includechildcontenttypes=[true   false]</code>	boolean	Parameter to include child content types in search criteria.
			<p>Specify the string to search for. (Mandatory)</p> <p>You can pass the appropriate value for any queryable attribute to fetch specific attributes.</p> <p>For a list of attributes, use a call to <code>...admin/attributes</code>.</p> <p>The attributes must be queryable.</p> <p>The following is a list of non-queryable attributes:</p> <ul style="list-style-type: none"> <li>• Article Component id</li> <li>• Article Component Reference Asset Id</li> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor Version</li> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> </ul>
	<code>attributes=[comma-separated list of attribute names or IDs]</code>	long or string	

			<ul style="list-style-type: none"> <li>• Attachment ChecksumAuxillary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> <li>• Page Index</li> <li>• Page Name</li> <li>• Relationship Status</li> <li>• Status</li> <li>• XPath</li> </ul>
Returns	Returns a <code>collectionInfoList</code> object containing an array of existing and accessible collections.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/search/collections ?collection path=Home/Collection&amp;Creator=Admin</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfoList&gt; &lt;collectionInfo templateId="0" collectionClass="General" collectionClassId="1416" collectionTemplate="false" accessibleChildrenAvailable="true" domainId="19" name="Collection" id="10"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;Collection&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Workflow" id="54"&gt;&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Collection" id="55"&gt;&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Routed to" id="25"&gt;&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Status" id="24"&gt;&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Content Type" id="62"&gt;General&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/collectionInfo&gt; &lt;/collectionInfoList&gt;</pre>		

Function	Search for collections in a collection with particular attributes.
Description	This request searches for assets in a specified collection and displays results with the specified attributes.
Type	GET
URL Format	<code>.../search/collections</code>

## REST FRAMEWORK SERVICES

<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	searchCollections		com.quark.qpp.service.facade Class QueryFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	attributes =[comma-separated list of attribute names or IDs]	long or string	For a list of attributes, use a call to ..admin/attributes.(Mandatory)
	collections =[comma-separated list of collections names or IDs]	long or string	Parameter to include child collections. To get a list of collection IDs for a particular collection, use a call to ..collectionsbypath/ [path]. (Mandatory)
	recursive=[true false]	boolean	Defaults to <b>true</b> . (Optional)
<b>Returns</b>	Returns a <code>collectionInfoList</code> object containing an array of existing and accessible collections.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/search/collections?collection path=Home&amp;Creator=Admin&amp;attributes=Name</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;collectionInfoList&gt; &lt;collectionInfo templateId="0" collectionClass="General" collectionClassId="1416" collectionTemplate="false" accessibleChildrenAvailable="true" domainId="19" name="Home" id="1"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;Home &lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;groupInfoList/&gt; &lt;/collectionInfo&gt; &lt;/collectionInfoList&gt;</pre>		

### createSearches

<b>Function</b>	Create searches.		
<b>Description</b>	This request creates a single or multiple searches at one time.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../searchdefinitions</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	createSearches		com.quark.qpp.service.facade Class QueryDefinitionFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	op=create	long	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	searchinfolist=[xml]	string	An XML object containing metadata of searches to be created.

Returns	Returns a <code>searchInfoList</code> object containing metadata of newly created searches.
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/searchdefinitions?op=create&amp;searchinfolist=&lt;xml/&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;searchInfoList&gt; &lt;searchInfo parameterized="false" id="110"&gt; &lt;searchName&gt;AllPictures&lt;/searchName&gt; &lt;owner id="1"&gt;Admin&lt;/owner&gt; &lt;queryContext context="ASSET"/&gt; &lt;queryConditionList&gt; &lt;queryCondition recursive="false" parameterized="false" negated="false" type="CONTENT_TYPE_CONDITION" comparisonOperator="IS" logicalOperator="OR" nestingLevel="1"&gt; &lt;searchValue id="1103"&gt;System;Asset;Picture;&lt;/searchValue&gt; &lt;/queryCondition&gt; &lt;/queryConditionList&gt; &lt;queryDisplay exploreMode="PLAIN" displayMode="SNIPPET"&gt; &lt;displayColumnList&gt; &lt;displayColumn attributeColumn="true" width="150" columnId="2"&gt;Name&lt;/displayColumn&gt; &lt;displayColumn attributeColumn="false" width="150" columnId="29"/&gt; &lt;displayColumn attributeColumn="false" width="150" columnId="62"/&gt; &lt;displayColumn attributeColumn="false" width="150" columnId="54"/&gt; &lt;displayColumn attributeColumn="false" width="150" columnId="25"/&gt; &lt;displayColumn attributeColumn="false" width="150" columnId="55"/&gt; &lt;/displayColumnList&gt; &lt;sortInfoList&gt; &lt;sortInfo attributeColumn="true" order="ascending" columnId="2"&gt;Name&lt;/sortInfo&gt; &lt;/sortInfoList&gt; &lt;/queryDisplay&gt; &lt;/searchInfo&gt; &lt;/searchInfoList&gt;</pre>

## getSearch

Function	Search for a saved search.		
Description	This request returns the metadata of a specified search.		
Type	GET		
URL Format	<code>.../searchdefinitions/{searchIdOrName}</code> ?		
Java API	Method Name		Class Name
	<code>getSearch</code>		<code>com.quark.qpp.service.facade</code> <code>Class QueryDefinitionFacade</code>
Parameters	Name	Type	Description
	<code>context=[true false]</code>	boolean	Defaults to <code>false</code> .
	<code>display=[true false]</code>	boolean	Defaults to <code>false</code> .
	<code>conditions=[true false]</code>	boolean	Defaults to <code>false</code> .
	<code>getSharedSearchTrustees=[true false]</code>	boolean	Defaults to <code>false</code> .
Returns	Returns a <code>searchInfoList</code> object containing metadata of all saved and shared searches. Metadata of <code>QueryContext</code> , <code>QueryDisplay</code> , <code>QueryConditions</code> will be added per the parameters.		
Examples	URL:		

## REST FRAMEWORK SERVICES

	<pre>http://serverName:serverPort/rest/service/searchdefinitions/Default</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;searchInfoList&gt; &lt;searchInfo parameterized="false" id="100"&gt; &lt;searchName&gt;Default&lt;/searchName&gt; &lt;owner id="1"&gt;Admin&lt;/owner&gt; &lt;/searchInfo&gt; &lt;/searchInfoList&gt;</pre>
--	---

### getAllSearches

<b>Function</b>	Get all saved searches.		
<b>Description</b>	This request returns all saved, shared searches.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../searchdefinitions?</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAllSearches</code>		<code>com.quark.qpp.service.facade.QueryDefinitionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>context=[true false]</code>	boolean	Defaults to false.
	<code>display=[true false]</code>	boolean	Defaults to false.
	<code>conditions=[true false]</code>	boolean	Defaults to false.
	<code>getSharedSearchTrustees=[true false]</code>	boolean	Defaults to false.
<b>Returns</b>	Returns a <code>searchInfoList</code> object containing metadata of all saved and shared searches. Metadata of QueryContext, QueryDisplay, QueryConditions will be added per the parameters.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/searchdefinitions</code> <b>Result:</b> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;searchInfoList&gt; &lt;searchInfo parameterized="false" id="100"&gt; &lt;searchName&gt;Default&lt;/searchName&gt; &lt;owner id="1"&gt;Admin&lt;/owner&gt; &lt;/searchInfo&gt; &lt;searchInfo parameterized="false" id="101"&gt; &lt;searchName&gt;Expired Content&lt;/searchName&gt; &lt;owner id="1"&gt;Admin&lt;/owner&gt; &lt;/searchInfo&gt; &lt;/searchInfoList&gt;</pre>		

### getSearchResultsForQuery

<b>Function</b>	Get the results of an existing search.	
<b>Description</b>	This request returns the results of the execution of an already saved search.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../search/[search name or ID]</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>

	getSearchResultsForQuery		com.quark.qpp.service.facade Class QueryFacade
Parameters	Name	Type	Description
	displaymode=[x].	long	Defaults to 1. The default display modes are documented in the JavaDoc SDK at com.quark.qpp.core.query.service.constants.DefaultDisplayModes.(Optional)
	exploreMode=[x]	long	Defaults to 0. For a list of explore modes, see ExploreModeTypes.java.
Returns	Returns an assetInfoList object containing the results of a specified search.		
Examples	<p><b>URL:</b>  <a href="http://serverName:serverPort/rest/service/search/Default">http://serverName:serverPort/rest/service/search/Default</a></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfoList&gt; &lt;assetInfo id="10"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;Tulips&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Collection" id="55"&gt;Home&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Workflow" id="54"&gt;Workflow&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Status" id="24"&gt;Status1&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;assetInfo id="11"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;Duplicate_asset&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Collection" id="55"&gt;Home&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Workflow" id="54"&gt;Workflow1&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Status" id="24"&gt;Status1&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;assetInfo id="4"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;1quark2.jpg&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Collection" id="55"&gt;Home&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Workflow" id="54"&gt;Workflow&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Status" id="24"&gt;Status1&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;assetInfo id="5"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;15116.qxp&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Collection" id="55"&gt;Home&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Workflow" id="54"&gt;Workflow1&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Status" id="24"&gt;Status1&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>		

Function	Get the results of an existing search with specific display attributes.	
Description	This request returns the results of the execution of an already saved search and displays only the specified attributes.	
Type	GET	
URL Format	.../search/[search name or ID]	
Java API	Method Name	Class Name
	getSearchResultsForQuery	com.quark.qpp.service.facade Class

## REST FRAMEWORK SERVICES

	QueryFacade		
Parameters	Name	Type	Description
	attributes =[comma-separated list of attribute names or IDs]	long or string	For a list of attributes, use a call to ...admin/attributes.(Mandatory)
Returns	Returns an assetInfoList object containing the results of a specified search with only the specified attributes.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/search/Default?attributes=Name,2,10,Collection</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfoList&gt; &lt;assetInfo id="10"&gt; &lt;attributeValueList&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;Tulips&lt;/attributeValue&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;Tulips&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Job jacket last modified" id="10"&gt;&lt;/attributeValue&gt; &lt;attributeValue type="popup" name="Collection" id="55"&gt;Home&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>		

Function	Get the results of an already saved “Ask” queries.		
Description	This request returns the result of an already saved search (Ask Queries) by accepting required values of search criteria as its parameters.		
Type	GET		
URL Format	<code>.../search/[search name OR id]</code>		
Java API	Method Name		Class Name
	<code>getSearchResultsForQuery</code>		<code>com.quark.qpp.service.facade</code> <code>Class QueryFacade</code>
Parameters	Name	Type	Description
	<code>text=[text to search for]</code>	string	Provide value for search criteria as its parameter. Parameter will be based upon the saved query. (Mandatory)
Parameters	<code>attributes=[comma-separated list of attribute names or IDs]</code>	string or long	You can pass the appropriate value for any queryable attribute to fetch specific attributes.  For a list of attributes, use a call to ...admin/attributes.
	Returns an assetInfoList containing the results of a specified search based on the given parameter and its value.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/search/myAskQuery?File%20extension=qxp</code></p> <p><b>Result:</b></p>		

	<pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfoList&gt; &lt;assetInfo id="1"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;Sample.qxp&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>
--	---

**getTextSearchResults**

<b>Function</b>	Search for assets using wild cards.		
<b>Description</b>	This request executes a quick search for assets based on their name. Both simple and wildcard based comparison is performed for name.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../search/quicksearch/</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getTextSearchResults</code>		<code>com.quark.qpp.service.facade</code> <code>Class QueryFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>collections =[comma-separated list of collection names or IDs]</code>	long or string	To get a list of collection IDs for a particular collection, use a call to <code>..collectionsbypath/ [path].(Mandatory)</code>
	<code>recursive=[true false]</code>	boolean	Parameter to include child collections. Defaults to <b>true</b> . (Optional)
			You can pass the appropriate value for any queryable attribute to fetch specific attributes.  For a list of attributes, use a call to <code>..admin/attributes</code> .  The attributes must be queryable.  The following is a list of non-queryable attributes: <ul style="list-style-type: none"><li>• Article Component id</li><li>• Article Component Reference Asset Id</li><li>• Article Component Reference Asset Major Version</li><li>• Article Component Reference Asset Minor Version</li><li>• Article Id</li><li>• Asset Checksum</li><li>• Attached Component Id</li><li>• Attached Layout Uid</li></ul>

			<ul style="list-style-type: none"> <li>Attachment ChecksumAuxillary Data</li> <li>Box Height</li> <li>Box Uid</li> <li>Box Width</li> <li>Collection</li> <li>Component position</li> <li>Dependent On Collection Resources</li> <li>InDesign Object UID</li> <li>Item Name</li> <li>Item Type</li> <li>Page Index</li> <li>Page Name</li> <li>Relationship Status</li> <li>Status</li> <li>XPath</li> </ul>
	<pre>includechildcontentypes=[true   false]</pre>	boolean	Parameter to include child content types in search criteria.
	<pre>sortby</pre>	long or string	attributeIds used for determining the sequence of asset elements in query results.
Returns	Returns an <code>assetInfoList</code> object .		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/search/quicksearch?text=*&gt;</pre> <p><b>Result:</b></p> <pre>&lt;assetInfoList&gt; &lt;assetInfo id="1"&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;151161dc.qxp&lt;/attributeValue&gt; &lt;attributeValue valueId="10" type="popup" name="Workflow" id="54"&gt;Workflow1&lt;/attributeValue&gt; &lt;attributeValue valueId="1" type="popup" name="Collection" id="55"&gt;Home&lt;/attributeValue&gt; &lt;attributeValue valueId="1" type="popup" name="Routed to" id="25"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue valueId="10" type="popup" name="Status" id="24"&gt;Status1&lt;/attributeValue&gt; &lt;attributeValue valueId="11021" type="popup" name="Content Type" id="62"&gt;QuarkXPress Project&lt;/attributeValue&gt; &lt;/attributeValueList&gt; &lt;/assetInfo&gt; &lt;/assetInfoList&gt;</pre>		

### setSharedSearchTrustees

Function	Share a search.
----------	-----------------

<b>Description</b>	This request shares any specified search to any user or group.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../searchdefinitions/{searchIdOrName}?</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getSharedSearchTrustees</code>		<code>com.quark.qpp.service.facade.QueryDefinitionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=setsharedsearchtrustees</code>	long	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>trusteeinfolist=[xml]</code>	string	An XML object containing metadata of all trustees (users, groups) that the search will be shared with.
<b>Returns</b>	Returns a <code>trusteeinfolist</code> object containing metadata of all trustees (users, groups) that the search will be shared with.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/searchdefinitions?op=setsharedsearchtrustees&amp;trusteeinfolist=&lt;xml/&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;trusteeInfoList&gt; &lt;trusteeInfo id="10"&gt; &lt;user&gt;true&lt;/user&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;name&gt;Admin2&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/trusteeInfo&gt; &lt;trusteeInfo id="12"&gt; &lt;user&gt;false&lt;/user&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;name&gt;Group1&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/trusteeInfo&gt; &lt;/trusteeInfoList&gt;</pre>		

## getSharedSearchTrustees

<b>Function</b>	Get the trustees of a shared search.		
<b>Description</b>	This request returns the trustees that a specified search has been shared with.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../searchdefinitions/{searchIdOrName}?</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getSharedSearchTrustees</code>		<code>com.quark.qpp.service.facade.QueryDefinitionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=getsharedsearchtrustees</code>	long	The op parameter allows you to specify which operation is to be performed.

## REST FRAMEWORK SERVICES

		(Mandatory)
Returns	Returns a <code>trusteeInfoList</code> object containing metadata of all trustees (users, groups) that a specified search has been shared with.	
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/searchdefinitions?op=ge tsharedsearchtrustees</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;trusteeInfoList&gt; &lt;trusteeInfo id="10"&gt; &lt;user&gt;true&lt;/user&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;name&gt;Admin2&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/trusteeInfo&gt; &lt;trusteeInfo id="12"&gt; &lt;user&gt;false&lt;/user&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;name&gt;Group1&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/trusteeInfo&gt; &lt;/trusteeInfoList&gt;</pre>	

## updateSearches

Function	Update searches.		
Description	This request updates a single or multiple searches at one time.		
Type	POST		
URL Format	<code>.../searchdefinitions</code>		
Java API	Method Name		Class Name
	<code>updateSearch</code>		<code>com.quark.qpp.service.facade</code> <code>Class QueryDefinitionFacade</code>
Parameters	Name	Type	Description
	<code>op=update</code>	long	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>searchinfolist=[xml]</code>	string	An XML object containing metadata of searches to be updated.
Returns	Returns a <code>searchinfolist</code> object containing metadata of successfully updated searches.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/searchdefinitions?op=up date&amp;searchinfilist=&lt;xml/&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;searchInfoList&gt; &lt;searchInfo parameterized="false" id="110"&gt; &lt;searchName&gt;AllPictures&lt;/searchName&gt; &lt;ownerid="1"&gt;Admin&lt;/owner&gt; &lt;queryContext context="ASSET"/&gt;</pre>		

	<pre> &lt;queryConditionList&gt; &lt;queryCondition recursive="false" parameterized="false" negated="false" type="CONTENT_TYPE_CONDITION"comparisonOperator="IS" logicalOperator="OR" nestingLevel="1"&gt; &lt;searchValueid="1103"&gt;System;Asset;Picture;&lt;/searchValue&gt; &lt;/queryCondition&gt; &lt;/queryConditionList&gt; &lt;queryDisplay exploreMode="PLAIN"displayMode="SNIPPET"&gt; &lt;displayColumnList&gt; &lt;displayColumn attributeColumn="true"width="150" columnId="2"&gt;Name&lt;/displayColumn&gt; &lt;displayColumn attributeColumn="false"width="150" columnId="29"/&gt; &lt;displayColumn attributeColumn="false"width="150" columnId="62"/&gt; &lt;displayColumn attributeColumn="false"width="150" columnId="54"/&gt; &lt;displayColumn attributeColumn="false"width="150" columnId="25"/&gt; &lt;displayColumn attributeColumn="false"width="150" columnId="55"/&gt; &lt;/displayColumnList&gt; &lt;sortInfoList&gt; &lt;sortInfo attributeColumn="true"order="ascending" columnId="2"&gt;Name&lt;/sortInfo&gt; &lt;/sortInfoList&gt; &lt;/queryDisplay&gt; &lt;/searchInfo&gt; &lt;/searchInfoList&gt; </pre>
--	---

## deleteSearch

<b>Function</b>	Delete searches.		
<b>Description</b>	This request deletes a specified search.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../searchdefinitions/{searchIdOrName}?</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateSearch</code>		<code>com.quark.qpp.service.facade</code> <code>Class QueryDefinitionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	long	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/searchdefinitions/{Save</code> <code>dSearchIdORName} ?op=delete</code>		

## count

<b>Function</b>	Count assets/collection using a searchDefinition.		
<b>Description</b>	This request counts assets/collections based on a given searchDefinition.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../search</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>count</code>		<code>com.quark.qpp.service.facade</code> <code>Class QueryFacade</code>

Parameters	Name	Type	Description
	searchinfo=[xml]	string	An XML object containing metadata of the asset/collections to be counted.
Returns	Returns a count of the assets, if the context of the given searchInfo is ASSET. Returns a count of the collections, if the context of the given searchInfo is COLLECTION		
Examples	<p><b>URL:</b>  <a href="http://serverName:serverPort/rest/service/search?search=&lt;xml/&gt;&amp;op=count">http://serverName:serverPort/rest/service/search?search=&lt;xml/&gt;&amp;op=count</a></p> <p><b>Result:</b>  30 </p>		

**countAssets**

Function	Count assets.		
Description	This request counts assets based on given conditions.		
Type	GET		
URL Format	.../search		
Java API	Method Name		Class Name
	countAssets		com.quark.qpp.service.facade Class QueryFacade
Parameters	Name	Type	Description
	op=count	long	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	assets =[comma-separated list of assets names or IDs]	long or string	(Mandatory)
	recursive=[true false]	boolean	Defaults to true.(Optional)
	includechildcontentty pes=[true   false]	boolean	Parameter to include child content types in search criteria.
	attributes=[comma-seperated list of attribute names or IDs]	long or string	<p>Specify the string to search for. (Mandatory)</p> <p>You can pass the appropriate value for any queryable attribute to fetch specific attributes.</p> <p>For a list of attributes, use a call to ...admin/attributes.</p> <p>The attributes must be queryable.</p> <p>The following is a list of non-queryable attributes:</p>

			<ul style="list-style-type: none"> <li>• Article Component id</li> <li>• Article Component Reference Asset Id</li> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor Version</li> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> <li>• Attachment ChecksumAuxillary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> <li>• Page Index</li> <li>• Page Name</li> <li>• Relationship Status</li> <li>• Status</li> <li>• XPath</li> </ul>
Returns	Returns a count of the assets satisfying the condition parameters specified.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/search/assets?op=count</code></p> <p><b>Result:</b>  <code>25</code></p>		

### countCollections

Function	Count collections.
----------	--------------------

## REST FRAMEWORK SERVICES

<b>Description</b>	This request counts collections based on given conditions.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../search</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>countCollections</code>		<code>com.quark.qpp.service.facade.QueryFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=count</code>	long	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>collections =[comma-separated list of collection names or IDs]</code>	long or string	Parameter to include child collections. To get a list of collection IDs for a particular collection, use a call to <code>..collectionsbypath/[path].</code> (Mandatory)
	<code>recursive=[true false]</code>	boolean	Defaults to <code>true</code> .(Optional)
	<code>includechildcontenttypes=[true   false]</code>	boolean	Parameter to include child content types in search criteria.
			<p>Specify the string to search for. (Mandatory)</p> <p>You can pass the appropriate value for any queryable attribute to fetch specific attributes.</p> <p>For a list of attributes, use a call to <code>..admin/attributes</code>.</p> <p>The attributes must be queryable.</p> <p>The following is a list of non-queryable attributes:</p> <ul style="list-style-type: none"> <li>• Article Component id</li> <li>• Article Component Reference Asset Id</li> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor Version</li> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> <li>• </li> </ul>

			<ul style="list-style-type: none"> <li>• Attachment ChecksumAuxillary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> <li>• Page Index</li> <li>• Page Name</li> <li>• Relationship Status</li> <li>• Status</li> <li>• XPath</li> </ul>
Returns	Returns a count of the collections satisfying the condition parameters specified.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/search/collections?op=count</code></p> <p><b>Result:</b>  <code>25</code></p>		

### countSearchResultsForQuery

Function	Count assets based on saved query.		
Description	This request counts resultant assets of saved query.		
Type	GET		
URL Format	<code>.../search/[Query ID or Name]</code>		
Java API	Method Name		Class Name
	<code>countSearchResultsForQuery</code>		<code>com.quark.qpp.service.facade</code> <code>Class QueryFacade</code>
Parameters	Name	Type	Description
	<code>op=count</code>	long	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributes=[comma-separated list of</code>	long or string	Specify the string to search for. (Mandatory)

## REST FRAMEWORK SERVICES

	<code>attribute names or IDs]</code>	<p>You can pass the appropriate value for any queryable attribute to fetch specific attributes.</p> <p>For a list of attributes, use a call to <code>..admin/attributes</code>.</p> <p>The attributes must be queryable.</p> <p>The following is a list of non-queryable attributes:</p> <ul style="list-style-type: none"> <li>• Article Component id</li> <li>• Article Component Reference Asset Id</li> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor Version</li> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> <li>• Attachment ChecksumAuxiliary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> <li>• Page Index</li> <li>• Page Name</li> <li>• Relationship Status</li> <li>• Status</li> <li>• XPath</li> </ul>
Returns	Returns a count of the assets satisfying the specified query.	

<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/search/AllAssets?op=count</pre> <p><b>Result:</b></p> <pre>2</pre>
-----------------	--

**countTextSearchResults**

<b>Function</b>	Count text search results.		
<b>Description</b>	This request counts assets based on given conditions.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../search/quicksearch</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>countTextSearchResults</code>		<code>com.quark.qpp.service.facade.QueryFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=count</code>	long	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>collections =[comma-separated list of collections names or IDs]</code>	long or string	Parameter to include child collections. To get a list of collection IDs for a particular collection, use a call to <code>...collectionsbypath/ [path]</code> .(Mandatory)
	<code>recursive=[true false]</code>	boolean	Defaults to <b>true</b> .(Optional)
	<code>includechildcontenttypes=[true   false]</code>	boolean	Parameter to include child content types in search criteria.
	<code>attributes=[comma-seperated list of attribute names or IDs]</code>	long or string	<p>Specify the string to search for. (Mandatory)</p> <p>You can pass the appropriate value for any queryable attribute to fetch specific attributes.</p> <p>For a list of attributes, use a call to <code>...admin/attributes</code>.</p> <p>The attributes must be queryable.</p> <p>The following is a list of non-queryable attributes:</p> <ul style="list-style-type: none"> <li>• Article Component id</li> <li>• Article Component Reference Asset Id</li> </ul>

			<ul style="list-style-type: none"> <li>• Article Component Reference Asset Major Version</li> <li>• Article Component Reference Asset Minor Version</li> <li>• Article Id</li> <li>• Asset Checksum</li> <li>• Attached Component Id</li> <li>• Attached Layout Uid</li> <li>• Attachment ChecksumAuxillary Data</li> <li>• Box Height</li> <li>• Box Uid</li> <li>• Box Width</li> <li>• Collection</li> <li>• Component position</li> <li>• Dependent On Collection Resources</li> <li>• InDesign Object UID</li> <li>• Item Name</li> <li>• Item Type</li> <li>• Page Index</li> <li>• Page Name</li> <li>• Relationship Status</li> <li>• Status</li> <li>• XPath</li> </ul>
Returns	Returns a count of the assets satisfying the condition parameters specified.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/search/quicksearch?text=*&amp;quark*&amp;op=count</pre> <p><b>Result:</b></p> <pre>2</pre>		

## Administration

The administration capabilities of the API allow application developers to perform administrative tasks and includes the following REST calls:

- *createUsers*
- *getUser*

- *getAllUsers*
- *getUsersWithGivenUserClass*
- *getAllUserRedliningColor*
- *updateUserRedliningColor*
- *updateUserEnabled*
- *updateUsers*
- *deleteUser*
- *createGroups*
- *getGroup*
- *getAllGroups*
- *getGroupsWithGivenUserClass*
- *getuserGroups*
- *updateGroups*
- *deleteGroup*
- *createContentTypes*
- *getContentType*
- *getAllContentTpes*
- *updateContentTypes*
- *deleteContentType*
- *createAttributes*
- *setAttributes*
- *getAttribute*
- *getAllAttributes*
- *updateAttributes*
- *deleteAttribute*
- *createForm*
- *getAllForms*
- *updateForms*
- *deleteForm*
- *createRoles*
- *getRole*
- *getAllRoles*
- *updateRoles*
- *deleteRole*

## REST FRAMEWORK SERVICES

- *createRelationType*
- *getRelationType*
- *getAllRelationTypes*
- *updateRelationTypes*
- *deleteRelationType*
- *createDomains*
- *getDomain*
- *getAllDomains*
- *updateDomains*
- *deleteDomain*
- *createLdapProfiles*
- *getLdapProfile*
- *getAllLdapProfiles*
- *updateLdapProfiles*
- *deleteLdapProfile*
- *getLdapUsers*
- *importUsersFromLdap*
- *getLdapGroups*
- *importGroupsFromLdap*
- *synchronizeLdapUsersGroups*
- *synchronizeLdapUsersGroupsBasedOnProfile*
- *createLdapSearches*
- *getLdapSearch*
- *getAllLdapSearches*
- *updateLdapSearches*
- *deleteLdapSearch*
- *getTrustee*
- *updateTrusteeRule*
- *createWorkflows*
- *getWorkflow*
- *getAllWorkflows*
- *updateWorkflows*
- *deleteWorkFlow*
- *createPreferences*

- *getPreference*
- *getAllPreferences*
- *updatePreferences*
- *getPreferenceValues*
- *updatePreferenceValues*
- *deletePreference*
- *createRepositories*
- *getRepository*
- *getAllRepositories*
- *updateRepositories*
- *deleteRepository*
- *createPrivileges*
- *getPrivilege*
- *getAllPrivileges*
- *getApplicableApplicationPrivileges*
- *getApplicableContentPrivileges*
- *updatePrivileges*
- *deletePrivilege*
- *createPrivilegeGroups*
- *getPrivilegeGroup*
- *getAllPrivilegeGroups*
- *updatePrivilegeGroups*
- *deletePrivilegeGroup*
- *addDomainValue*
- *getDomainValue*
- *getDomainValueXML*
- *setDomainValueXML*
- *searchDomainValues*
- *updateDomainValue*
- *deleteDomainValue*
- *getFavorites*
- *setFavorites*
- *getWorkflowInitiatingStatuses*
- *getStatusTransitions*

**createUsers**

<b>Function</b>	Create users.		
<b>Description</b>	This request is used to create users. The new user will be created without a password, client needs to set the password for the user separately.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/users</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createUsers</code>		<code>com.quark.qpp.service.facade Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>userinfoList</code>		<p>Object containing a list of the users (userInfo) to be created. See the userInfoList paramater in "Request/Response parameter formats". The following are mandatory attributes required to create a user:</p> <ul style="list-style-type: none"> <li>• Name</li> <li>• DefaultUserClass</li> <li>• Enabled,NativeTrustee</li> <li>• DefaultUserClassId</li> </ul>
<b>Returns</b>	Returns a <code>userInfoList</code> object containing metadata of a newly created user.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/users?op=create&amp;userinfoList= &lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;userInfoList&gt; &lt;userInfo&gt; &lt;name&gt;SampleQPPGroup&lt;/name&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;true&lt;/enabled&gt; &lt;defaultUserClassId&gt;1&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Administrator&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; &lt;/userInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;userInfoList&gt; &lt;userInfo id="14"&gt; &lt;name&gt;SampleQPPGroup&lt;/name&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;true&lt;/enabled&gt; &lt;defaultUserClassId&gt;1&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Administrator&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; &lt;/userInfoList&gt;Example with multiple usersURL:<a &lt;defaultuserclassid&gt;1&lt;="" &lt;enabled&gt;true&lt;="" &lt;name&gt;sampleqppgroup1&lt;="" &lt;nativetrustee&gt;true&lt;="" &lt;userinfo&gt;="" &lt;userinfolist&gt;="" 1.0"="" ?&gt;="" defaultuserclassid&gt;"="" enabled&gt;="" encoding="UTF-8" href="http://serverName:serverPort/rest/service/admin/users?op=create&amp;userinfoList= &lt;?xml version=" name&gt;="" nativetrustee&gt;="">http://serverName:serverPort/rest/service/admin/users?op=create&amp;userinfoList= &lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;userinfoList&gt; &lt;userinfo&gt; &lt;name&gt;SampleQPPGroup1&lt;/name&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;true&lt;/enabled&gt; &lt;defaultUserClassId&gt;1&lt;/defaultUserClassId&gt;</a></pre>		

```

<defaultUserClass>Administrator</defaultUserClass>

<ldapProfileId>0</ldapProfileId> <deleted>false</deleted>
<ldapDistinguishedName>Dist Name</ldapDistinguishedName>
</userInfo> </userInfoList>

```

## getUser

<b>Function</b>	Get specific user.	
<b>Description</b>	This request is used to get the metadata of a specified user.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../admin/users/[userIdOrUserName]</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getUser</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters	
<b>Returns</b>	Returns an <code>userInfoList</code> object with its metadata.	
<b>Examples</b>	<b>URL:</b>  <code>http://serverName:serverPort/rest/service/users/Admin</code>	
	<b>Result:</b>  <pre> &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;userInfoList&gt; &lt;userInfo id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;firstName&gt;Administrator&lt;/firstName&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;true&lt;/enabled&gt; &lt;defaultUserClassId&gt;1&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Administrator&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; &lt;/userInfoList&gt; </pre>	

## getAllUsers

<b>Function</b>	Get all users.
-----------------	----------------

## REST FRAMEWORK SERVICES

<b>Description</b>	This request is used to fetch all users.				
<b>Type</b>	GET				
<b>URL Format</b>	<code>.../admin/users</code>				
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>			
	<code>getAllUsers</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>			
<b>Parameters</b>	This request requires no input parameters				
<b>Returns</b>	Returns an <code>userInfoList</code> object containing metadata of users in the form of an array.				
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/users</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;userInfoList&gt; &lt;userInfo id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;firstName&gt;Administrator&lt;/firstName&gt; &lt;phoneNumber&gt;+911722299000&lt;/phoneNumber&gt; &lt;emailAddress&gt;platformadmin@quark.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;true&lt;/enabled&gt; &lt;defaultUserClassId&gt;1&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Administrator&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;user&gt;true&lt;/user&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;overriddenUserClassId&gt;0&lt;/overriddenUserClassId&gt; &lt;/userInfo&gt; &lt;/userInfoList&gt;</pre>				

### getUsersWithGivenUserClass

<b>Function</b>	Get users with the default given userclass.		
<b>Description</b>	This request returns the platform users with the specified user class.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../admin/roles/{roleIdORroleName}</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>getUsersWithGivenUserClass</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>users</code>	string	true
<b>Returns</b>	Returns a <code>userInfoList</code> containing metadata of all the users belonging to the specified userClass in array format.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/roles/Administrato r?users=true</code></p> <p><b>Result:</b></p>		

	<pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;userInfoList&gt; &lt;userInfo id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;firstName&gt;Administrator&lt;/firstName&gt; &lt;emailAddress&gt;qppadministrator@quark.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;true&lt;/enabled&gt; &lt;defaultUserClassId&gt;1&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Administrator&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;user&gt;true&lt;/user&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;overriddenUserClassId&gt;0&lt;/overriddenUserClassId&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; &lt;userInfo id="10"&gt; &lt;name&gt;Admin2&lt;/name&gt; ..... &lt;/userInfo&gt; &lt;/userInfoList&gt;</pre>
--	---

### getAllUserRedliningColor

<b>Function</b>	Get a list of all users along with redline colors.	
<b>Description</b>	This request returns a list of all the users along with their redlining colors.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../redline</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllUserRedliningColor</code>	<code>com.quark.qpp.service.facadeClass AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns list of all the users along with their redlining colors.	
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/admin/redline</code> <b>Result:</b> <pre>&lt;redlineInfoList&gt; &lt;redlineInfo&gt; &lt;color blue="0" green="0" red="0"/&gt; &lt;user id="11"&gt;BOT&lt;/user&gt; &lt;/redlineInfo&gt; &lt;redlineInfo&gt; &lt;color blue="0" green="0" red="0"/&gt; &lt;user id="1"&gt;Admin&lt;/user&gt; &lt;/redlineInfo&gt; &lt;redlineInfo&gt; &lt;color blue="0" green="0" red="0"/&gt; &lt;user id="10"&gt;Admin2&lt;/user&gt; &lt;/redlineInfo&gt; &lt;/redlineInfoList&gt;</pre>	

<b>Function</b>	Get Redline color for a given user.		
<b>Description</b>	This request returns the defined redlining color for the given user.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../redline</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAllUserRedliningColor</code>		<code>com.quark.qpp.service.facadeClass AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	user	string	Name of the user for which redline color information is to be fetched.
<b>Returns</b>	Returns the defined redlining color for the given user. Returns specific privilege(s) in system with given id or name. If privilege name is		

## REST FRAMEWORK SERVICES

	specified and there exists multiple privileges in different privilege groups, with the given name, list of all such privileges will be returned.
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/redline?user=Admin</pre> <p><b>Result:</b></p> <pre>&lt;redlineInfoList&gt; &lt;redlineInfo&gt; &lt;color blue="252" green="8" red="126"/&gt; &lt;user id="1"&gt;Admin&lt;/user&gt; &lt;/redlineInfo&gt; &lt;/redlineInfoList&gt;</pre>

### updateUserRedliningColor

Function	Updates the redlining color for the given user(s).		
Description	This request updates the redlining color for the given user(s).		
Type	POST		
URL Format	<code>.../redline? op=update</code>		
Java API	<b>Method Name</b>		<b>Class Name</b>
	<code>updateUserRedliningColor</code>		<code>com.quark.qpp.service.facadeClass AdminFacade</code>
Parameters	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>redlineinfolist=&lt;XML/&gt;</code>	string	A redLineInfoList object in XML format. See “Request/Response parameter formats.”
Returns	Returns the defined redlining color for the given user(s).		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/redline?user=BOT</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;redlineInfoList&gt; &lt;redlineInfo&gt; &lt;color blue="10" green="56" red="115"/&gt; &lt;user id="11"&gt;BOT&lt;/user&gt; &lt;/redlineInfo&gt; &lt;/redlineInfoList&gt;</pre>		

### updateUserEnabled

Function	Enables/disables the Platform Server Logon for the given user.		
Description	This request enables/disables the Platform Server logon for the given user.		
Type	POST		
URL Format	<code>.../admin/users/{userIdOrName}</code>		
Java API	<b>Method Name</b>		<b>Class Name</b>
	<code>updateUserEnabled</code>		<code>com.quark.qpp.service.facade Class AdminFacade</code>
Parameters	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=setenabled</code>	string	The op parameter allows you to specify

			which operation is to be performed. (Mandatory)
			This operation will run only for a valid session id.
	<code>enabled=[True] or [False]</code>	boolean	
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/users/John?op=setEnabled&amp;enabled=true</code></p>		

## updateUsers

<b>Function</b>	Update users.		
<b>Description</b>	This request is used to update a single user or multiple users at one time.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.... /admin/users</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateUsers</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>userinfoList=&lt;xml/&gt;</code>		Object containing a list of the successfully updated users .
<b>Returns</b>	Returns a <code>UserInfoList</code> object containing a list of all the successfully updated users.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/users?userinfo list= &lt;userInfoList&gt; &lt;userInfo id="33"&gt; &lt;name&gt;Tom&lt;/name&gt; &lt;firstName&gt;Tom&lt;/firstName&gt; &lt;lastName&gt;Rodrigues&lt;/lastName&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;false&lt;/enabled&gt; &lt;defaultUserClassId&gt;12&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Editor&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; &lt;/userInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;userInfoList&gt; &lt;userInfo id="33"&gt; &lt;name&gt;Tom&lt;/name&gt; &lt;firstName&gt;Tom&lt;/firstName&gt; &lt;lastName&gt;Rodrigues&lt;/lastName&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;false&lt;/enabled&gt; &lt;defaultUserClassId&gt;12&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Editor&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; &lt;/userInfoList&gt;</pre>		

	<p><b>Example with multiple content types</b></p> <p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/users?userinfo list= &lt;userInfoList&gt; &lt;userInfo id="33"&gt; &lt;name&gt;Tom&lt;/name&gt; &lt;firstName&gt;Tom&lt;/firstName&gt; &lt;lastName&gt;Rodrigues&lt;/lastName&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;false&lt;/enabled&gt; &lt;defaultUserClassId&gt;12&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Editor&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; &lt;userInfo id="34"&gt; &lt;name&gt;Sam&lt;/name&gt; &lt;firstName&gt;Sam&lt;/firstName&gt; &lt;lastName&gt;Rodrigues&lt;/lastName&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;false&lt;/enabled&gt; &lt;defaultUserClassId&gt;12&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Editor&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; &lt;/userInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;userInfoList&gt; &lt;userInfo id="33"&gt; &lt;name&gt;Tom&lt;/name&gt; &lt;firstName&gt;Tom&lt;/firstName&gt; &lt;lastName&gt;Rodrigues&lt;/lastName&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;false&lt;/enabled&gt; &lt;defaultUserClassId&gt;12&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Editor&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; &lt;userInfo id="34"&gt; &lt;name&gt;Sam&lt;/name&gt; &lt;firstName&gt;Sam&lt;/firstName&gt; &lt;lastName&gt;Rodrigues&lt;/lastName&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;enabled&gt;false&lt;/enabled&gt; &lt;defaultUserClassId&gt;12&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Editor&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;0&lt;/ldapProfileId&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;/userInfo&gt; &lt;/userInfoList&gt;</pre>
--	---

**deleteUser**

<b>Function</b>	Delete a user.		
<b>Description</b>	This request is used to delete the specified user.		
<b>Type</b>	POST		
<b>URL Format</b>	.../admin/users/ [userIdORName]		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	deleteUser		com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	op=delete	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	userIdORName		Id or Name of the user to be deleted.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b>		

	<code>http://serverName:serverPort/rest/service/admin/users/32?op=delete</code>
--	---

**createGroups**

<b>Function</b>	Create groups.		
<b>Description</b>	This request is used to create a single or multiple groups at one time.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/groups</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createGroups</code>		<code>com.quark.qpp.service.facade Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>groupInfoList</code>		Object containing list of groups to be created. See “Request/Response parameter formats.”
<b>Returns</b>	Returns a <code>groupInfoList</code> object containing its metadata and memberlist.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/groups?op=create &amp;groupInfo=&lt;groupInfoList&gt; &lt;name&gt;Editorial&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;Profile Name&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;memberList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; ..... &lt;/memberList&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;groupInfo id="48"&gt; &lt;name&gt;SampleQPDzxcdPGroup&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;Profile Name&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;memberList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; &lt;nameId id="10"&gt; &lt;name&gt;Admin2&lt;/name&gt; &lt;/nameId&gt; &lt;/memberList&gt; &lt;/groupInfo&gt;&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;groupInfoList&gt; &lt;groupInfo id="20"&gt; &lt;name&gt;Editoria&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;Profile Name&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt;Dist</pre>		

## REST FRAMEWORK SERVICES

	<pre>Name&lt;/ldapDistinguishedName&gt; &lt;memberOfList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; ..... &lt;/memberOfList&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre> <p><b>Multiple Groups Example:</b></p> <p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/groups?op=create&amp;groupinfoList= &lt;groupInfoList&gt; &lt;groupInfo&gt; &lt;name&gt;Department&lt;/name&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;memberOfList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; ..... &lt;/memberOfList&gt; &lt;/groupInfo&gt; &lt;groupInfo&gt; &lt;name&gt;Production&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;Profile Name&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;memberOfList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; ..... &lt;/memberOfList&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;groupInfoList&gt; &lt;groupInfo id="21"&gt; &lt;name&gt;Department&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;Profile Name&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;memberOfList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; ..... &lt;/memberOfList&gt; &lt;/groupInfo&gt; &lt;groupInfo id="22"&gt; &lt;name&gt;Production&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;Profile Name&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;memberOfList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; ..... &lt;/memberOfList&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre>
--	--

### getGroup

<b>Function</b>	Get a group with a particular ID or Name.	
<b>Description</b>	This request returns all the metadata of specified group.	
<b>Type</b>	GET	
<b>URL Format</b>	.../admin/groups/[groupIDorgroupName]	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	getGroup	com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>groupInfoList</code> object in XML format of specified group. See the table in the “Request/Response parameter formats” chapter.	
<b>Examples</b>	<b>URL:</b>	

	<p><code>http://serverName:serverPort/rest/service/admin/groups/21</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;groupInfoList&gt; &lt;groupInfo id="21"&gt; &lt;name&gt;Department&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;Profile Name&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;memberList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; ..... &lt;/memberList&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre>
--	--

### getAllGroups

<b>Function</b>	Get all groups.	
<b>Description</b>	This request returns all groups includin its members.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../admin/groups</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllGroups</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>groupInfoList</code> object containing an array of groups that exist on the QPP server. See the table in the “Request/Response parameter formats” chapter.	
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/groups</code></p> <p><b>Result:</b></p> <pre>&lt;groupInfoList&gt; &lt;groupInfo&gt; &lt;name&gt;gp34&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;Profile Name&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;memberList&gt; &lt;nameId name="Sam" /&gt; &lt;nameId id="1"/&gt; &lt;/memberList&gt; &lt;/groupInfo&gt; &lt;groupInfo &gt; &lt;name&gt;gp35&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;Profile Name&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;memberList&gt; &lt;nameId name="Sam" /&gt; &lt;nameId id="1"/&gt; &lt;/memberList&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre>	

**getGroupsWithGivenUserClass**

<b>Function</b>	Get groups with the given role.		
<b>Description</b>	This request returns the Platform Server groups with the given role.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../admin/roles/{roleIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getGroupsWithGivenUserClass</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>groups=[true]</code>	<code>boolean</code>	
<b>Returns</b>	Returns a <code>groupInfoList</code> object containing a list of groups that have the default role.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/roles/Administrator? groups=true</code></p> <p><b>Result:</b></p> <pre>&lt;groupInfoList&gt; &lt;groupInfo id="12"&gt; &lt;name&gt;Editors&lt;/name&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;1&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Administrator&lt;/defaultUserClass&gt; &lt;memberList&gt; &lt;nameId id="3680"&gt; &lt;name&gt;John&lt;/name&gt; &lt;/nameId&gt; &lt;/memberList&gt; &lt;/groupInfo&gt; &lt;groupInfo id="13"&gt; &lt;name&gt;Publishers&lt;/name&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;defaultUserClass&gt;Administrator&lt;/defaultUserClass&gt; &lt;memberList&gt; &lt;nameId id="10"&gt; &lt;name&gt;Mathias&lt;/name&gt; &lt;/nameId&gt; ..... &lt;/memberList&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre>		

**getUserGroups**

<b>Function</b>	Get groups of a user.		
<b>Description</b>	This request returns all groups to which the given user belongs.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../admin/users/{userIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getUserGroups</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>userIdOrName</code>	<code>string</code>	
<b>Returns</b>	Returns a <code>groupInfoList</code> object containing a list of groups of which the given user is a member.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/users/John?groups=true</code></p>		

	<p><b>Result:</b></p> <pre>&lt;groupInfoList&gt; &lt;groupInfo id="12"&gt; &lt;name&gt;Editors&lt;/name&gt; &lt;nativeTrustee&gt;true&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;123&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;Editors&lt;/defaultUserClass&gt; &lt;/groupInfo&gt; &lt;groupInfo id="3681"&gt; &lt;name&gt;QPP Server&lt;/name&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;10&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;UserClass2&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;764&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;QPP LDAP Profile&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt; CN=QPP Server,OU=DistributionLists,OU=QMHI,DC=india,DC=quark,DC=com &lt;/ldapDistinguishedName&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre>
--	---

## updateGroups

<b>Function</b>	Update groups.		
<b>Description</b>	This request is used to update a single or multiple groups at one time.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/groups</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateGroups</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>groupinfolist</code>	XML	Object containing information for single or multiple groups. See “Request/Response parameter formats.”
<b>Returns</b>	Returns a <code>groupInfoList</code> object containing a list of all successfully updated groups.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/groups?op=update&amp;groupInfo= &lt;groupInfoList&gt; &lt;groupInfo id="22"&gt; &lt;name&gt;Production&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;Profile Name&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;memberList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; ..... &lt;/memberList&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;groupInfoList&gt; &lt;groupInfo id="22"&gt; &lt;name&gt;Production&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;defaultUserClass&gt;NoPrivileges&lt;/defaultUserClass&gt;</pre>

--	---

### deleteGroup

<b>Function</b>	Delete a group.	
<b>Description</b>	This request is used to delete the group with the given id or name.	
<b>Type</b>	POST	
<b>URL Format</b>	<code>....//admin/group/[groupIdORgroupName]</code>	
<b>Java API</b>	Method Name	Class Name

	deleteGroup		com.quark.qpp.service.facade Class AdminFacade
Parameters	Name	Type	Description
	op=delete	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p>URL:  <a href="http://serverName:serverPort/rest/service/admin/groups/[groupIdORgroupName]?op=delete">http://serverName:serverPort/rest/service/admin/groups/[groupIdORgroupName]?op=delete</a></p>		

### createContentTypes

Function	Create content types.		
Description	This request is used to create one or more content types and its child content types according to the parent content type ID.		
Type	POST		
URL Format	<a href=".../admin/contenttypes">.../admin/contenttypes</a>		
Java API	Method Name		Class Name
	createContentTypes		com.quark.qpp.service.facade Class AdminFacade
Parameters	Name	Type	Description
	op=create	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Parameters	contenttypeinfolist=<xml/>		Object containing a list of the content types to be created. After the creation of a content type, the child content types defined will be considered for creation. See the contentTypeInfoList parameter in "Request/Response parameter formats".
	contenttypeinfoList		object containing the successfully created content types..
Returns	Returns a <code>contentTypeInfoList</code> object containing the successfully created content types..		
	<p>URL:  <a href="http://serverName:serverPort/rest/service/admin/contenttypes?op=create&amp;contenttypeinfolist=&lt;contentTypeInfoList&gt;&lt;contentTypeInfo&gt;&lt;name&gt;Pru Child1&lt;/name&gt;&lt;extensible&gt;true&lt;/extensible&gt;&lt;parentContentTypeId&gt;10010&lt;/parentContentTypeId&gt;&lt;contentTypeInfoList&gt;&lt;contentTypeInfo&gt;&lt;name&gt;Child of Project 1&lt;/name&gt;&lt;extensible&gt;true&lt;/extensible&gt;&lt;/contentTypeInfo&gt;&lt;/contentTypeInfoList&gt;&lt;/contentTypeInfo&gt;&lt;/contentTypeInfoList&gt;">http://serverName:serverPort/rest/service/admin/contenttypes?op=create&amp;contenttypeinfolist=&lt;contentTypeInfoList&gt;&lt;contentTypeInfo&gt;&lt;name&gt;Pru Child1&lt;/name&gt;&lt;extensible&gt;true&lt;/extensible&gt;&lt;parentContentTypeId&gt;10010&lt;/parentContentTypeId&gt;&lt;contentTypeInfoList&gt;&lt;contentTypeInfo&gt;&lt;name&gt;Child of Project 1&lt;/name&gt;&lt;extensible&gt;true&lt;/extensible&gt;&lt;/contentTypeInfo&gt;&lt;/contentTypeInfoList&gt;&lt;/contentTypeInfo&gt;&lt;/contentTypeInfoList&gt;</a></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="10011"&gt; &lt;name&gt;Pru Child1&lt;/name&gt; &lt;contentTypeHierarchy&gt;System;Asset;Prudencial;Pru</pre>

```

<b>Function</b>	Create content types through content type hierarchy
<b>Description</b>	This request is used to create one or more content types and its child content types according to the specified hierarchy

Type	POST		
URL Format	.../admin/contenttypes		
Java API	Method Name		Class Name
	createContentTypes		com.quark.qpp.service.facade Class AdminFacade
Parameters	Name	Type	Description
	op=create	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	Object containing a list of the content types to be created. After the creation of a content type, the child content types defined will be considered for creation. See the contentTypeInfoList parameter in "Request/Response parameter formats".		
	Returns a contentTypeInfoList object containing the successfully created content types.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/contenttypes?op=create&amp;contenttypeinfoList= &lt;contentTypeInfoList&gt; &lt;contentTypeInfo&gt; &lt;name&gt;Prudencial&lt;/name&gt; &lt;contentTypeHierarchy&gt;System;Asset;Prudencial;&lt;/contentTypeHierarchy&gt; &lt;extensible&gt;true&lt;/extensible&gt; &lt;contentTypeAttributeMappingInfoList&gt; &lt;contentTypeAttributeMappingInfo valueMandatory="true"&gt;Pru_Id&lt;/contentTypeAttributeMappingInfo&gt; &lt;contentTypeAttributeMappingInfo userMapped="true" valueMandatory="false" attributeId="501"&gt;Master Text &lt;/contentTypeAttributeMappingInfo&gt; ..... &lt;/contentTypeAttributeMappingInfoList&gt; &lt;/contentTypeInfo&gt; &lt;/contentTypeInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="10010"&gt; &lt;name&gt;Prudencial&lt;/name&gt; &lt;contentTypeHierarchy&gt;System;Asset;Prudencial;&lt;/contentTypeHierarchy&gt; &lt;parentContentTypeId&gt;1100&lt;/parentContentTypeId&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;extensible&gt;true&lt;/extensible&gt; &lt;contentTypeAttributeMappingInfoList&gt; &lt;contentTypeAttributeMappingInfo userMapped="false" valueMandatory="false" attributeId="1"&gt;Id &lt;/contentTypeAttributeMappingInfo&gt; &lt;contentTypeAttributeMappingInfo userMapped="false" valueMandatory="true" attributeId="2"&gt;Name &lt;/contentTypeAttributeMappingInfo&gt; ..... &lt;/contentTypeAttributeMappingInfoList&gt; &lt;/contentTypeInfo&gt; &lt;/contentTypeInfoList&gt;</pre>		

## getContentType

Function	Get content type.
----------	-------------------

## REST FRAMEWORK SERVICES

<b>Description</b>	This request returns complete information on the specified content type. This will also include the child content types.		
<b>Type</b>	Get		
<b>URL Format</b>	<code>.../admin/contenttypes/{contenttypeIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getContentType</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>contentTypeIdOrName</code>	<code>string</code>	The ID or Name of the content type to be retrieved.
<b>Returns</b>	Returns a <code>contentTypeInfoList</code> object containing information on the specified content type inclusive of its children .		
<b>Examples</b>	<p><b>URL:</b></p> <pre><code>http://serverName:serverPort/rest/service/admin/contenttypes/10000</code></pre> <p><b>Result:</b></p> <pre><code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="10000"&gt; &lt;name&gt;Master&lt;/name&gt; &lt;contentTypeHierarchy&gt;System;Article Component;Picture Component;Master;&lt;/contentTypeHierarchy&gt; &lt;parentContentTypeId&gt;1300&lt;/parentContentTypeId&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;extensible&gt;false&lt;/extensible&gt; &lt;created&gt;2013-11- 22T07:04:29Z&lt;/created&gt; &lt;creator&gt;1&lt;/creator&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;lastModified&gt;2013-11- 22T07:04:29Z&lt;/lastModified&gt; &lt;lastModifier&gt;1&lt;/lastModifier&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;contentTypeAttributeMappingInfoList&gt; &lt;contentTypeAttributeMappingInfo userMapped="false" valueMandatory="false" attributeId="1"&gt;Id &lt;/contentTypeAttributeMappingInfo&gt; &lt;contentTypeAttributeMappingInfo userMapped="false" valueMandatory="false" attributeId="51"&gt;First page &lt;/contentTypeAttributeMappingInfo&gt; ..... &lt;/contentTypeAttributeMappingInfoList&gt; &lt;/contentTypeInfo&gt; &lt;/contentTypeInfoList&gt;</code></pre>		

### getAllContentTypes

<b>Function</b>	Get all content types.		
<b>Description</b>	This request returns complete information of all content types in the system in a hierarchical structure.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../admin/contenttypes</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAllContentTypes</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters		

<b>Returns</b>	Returns a <code>contentTypeInfoList</code> object containing an array of content types ( <code>contentTypeInfo</code> ).
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/contenttypes</pre> <p><b>Result:</b></p> <pre>&lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="1502"&gt; &lt;name&gt;Web&lt;/name&gt; &lt;contentTypeHierarchy&gt;System;Layout;Web;&lt;/contentTypeHierarchy&gt; &lt;parentContentTypeId&gt;1500&lt;/parentContentTypeId&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;extensible&gt;false&lt;/extensible&gt; &lt;created&gt;2012-04-01T10:00:00Z&lt;/created&gt; &lt;creator&gt;1&lt;/creator&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;lastModified&gt;2012-04-01T10:00:00Z&lt;/lastModified&gt; &lt;lastModifier&gt;1&lt;/lastModifier&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;contentTypeAttributeMappingInfoList&gt; &lt;contentTypeAttributeMappingInfo userMapped="false" valueMandatory="false" attributeId="1"&gt;Id&lt;/contentTypeAttributeMappingInfo&gt; &lt;contentTypeAttributeMappingInfo userMapped="false" valueMandatory="false" attributeId="43"&gt;Number of pages&lt;/contentTypeAttributeMappingInfo&gt; ..... &lt;/contentTypeAttributeMappingInfoList&gt; &lt;/contentTypeInfo&gt; &lt;/contentTypeInfoList&gt;</pre>

## updateContentTypes

<b>Function</b>	Update content types.		
<b>Description</b>	This request is used to update content types and their children according to the specified id or contentTypeHierarchy.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.... /admin/contenttypes</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateContentTypes</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>contenttypeinfolist=&lt;xml/&gt;</code>		Object containing a list of the successfully updated content types .
<b>Returns</b>	Returns a <code>contentTypeInfoList</code> object containing a list of all the successfully updated content types..		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/contenttypes?op=update&amp;contenttypeinfolist= &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="10015"&gt; &lt;contentTypeAttributeMappingInfoList&gt; &lt;contentTypeAttributeMappingInfo&gt; &lt;attributeName&gt;Id&lt;/attributeName&gt;</pre>		

## REST FRAMEWORK SERVICES

--	--

### deleteContentType

<b>Function</b>	Delete a content type.		
<b>Description</b>	This request is used to delete the specified content type.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/contenttypes/{contenttypeIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>deleteContentType</code>		<code>com.quark.qpp.service.facade</code> Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>contentTypeIdOrName</code>	string	Id or Name of the content type to be deleted.
	<code>attributes= [comma-separated list of attribute names or IDs]</code>	string	Attributes Ids or Names.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b>		
	<code>http://serverName:serverPort/rest/service/admin/contenttypes/1001</code> <code>5?op=delete:</code>		

### createAttributes

<b>Function</b>	Create Attributes.		
<b>Description</b>	This request is used to create a single or multiple attributes at one time.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/attributes</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createAttributes</code>		<code>com.quark.qpp.service.facade</code> Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed.

## REST FRAMEWORK SERVICES

			(Mandatory)
	<code>attributeinfolist</code>	string	List of attributes to create.
<b>Returns</b>	Returns a <code>attributeInfoList</code> object containing a list of successfully created attributes.		
	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/attributes?op=create&amp;attributeinfolist= &lt;attributeInfoList&gt; &lt;attributeInfo&gt; &lt;name&gt;Collections Sequence&lt;/name&gt; &lt;valueType&gt;TEXT&lt;/valueType&gt; &lt;queryable&gt;true&lt;/queryable&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;displayable&gt;true&lt;/displayable&gt; &lt;valuePreferencesChangeable&gt;true&lt;/valuePreferencesChangeable&gt; &lt;attributeValuePreferenceInfo&gt; &lt;defaultValue&gt;From Creation to Publishing&lt;/defaultValue&gt; &lt;/attributeValuePreferenceInfo&gt; &lt;/attributeInfo&gt; &lt;/attributeInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;attributeInfoList&gt; &lt;attributeInfo id="519"&gt; &lt;name&gt;Collections Sequence&lt;/name&gt; &lt;valueTypeId&gt;1&lt;/valueTypeId&gt; &lt;valueType&gt;TEXT&lt;/valueType&gt; &lt;userDefined&gt;true&lt;/userDefined&gt; &lt;queryable&gt;true&lt;/queryable&gt; &lt;modificationLevel&gt;USER_MODIFIABLE&lt;/modificationLevel&gt; &lt;created&gt;2013-12-05T05:52:57Z&lt;/created&gt; &lt;creator&gt;1&lt;/creator&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;lastModified&gt;2013-12-05T05:52:57Z&lt;/lastModified&gt; &lt;lastModifier&gt;1&lt;/lastModifier&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;displayable&gt;true&lt;/displayable&gt; &lt;limitedAccess&gt;false&lt;/limitedAccess&gt; &lt;limitedAccessChangeable&gt;true&lt;/limitedAccessChangeable&gt; &lt;constraintsChangeable&gt;true&lt;/constraintsChangeable&gt; &lt;valuePreferencesChangeable&gt;true&lt;/valuePreferencesChangeable&gt; &lt;attributeValuePreferenceInfo&gt; &lt;defaultValue&gt;From Creation to Publishing&lt;/defaultValue&gt; &lt;textSearchEnabled&gt;false&lt;/textSearchEnabled&gt; &lt;/attributeValuePreferenceInfo&gt; &lt;/attributeInfo&gt; &lt;/attributeInfoList&gt;</pre> <p><b>Example with multiple attributes:</b></p> <p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/attributes?op=create&amp;attributeinfolist= &lt;attributeInfoList&gt; &lt;attributeInfo&gt; &lt;name&gt;Collections Sequence 1&lt;/name&gt; &lt;valueType&gt;TEXT&lt;/valueType&gt; &lt;queryable&gt;true&lt;/queryable&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;displayable&gt;true&lt;/displayable&gt; &lt;valuePreferencesChangeable&gt;true&lt;/valuePreferencesChangeable&gt; &lt;attributeValuePreferenceInfo&gt; &lt;defaultValue&gt;From Creation to Publishing&lt;/defaultValue&gt; &lt;/attributeValuePreferenceInfo&gt; &lt;/attributeInfo&gt; &lt;attributeInfo&gt; &lt;name&gt;Collections Sequence 2&lt;/name&gt; &lt;valueType&gt;TEXT&lt;/valueType&gt; &lt;queryable&gt;true&lt;/queryable&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;displayable&gt;true&lt;/displayable&gt; &lt;valuePreferencesChangeable&gt;true&lt;/valuePreferencesChangeable&gt; &lt;attributeValuePreferenceInfo&gt; &lt;defaultValue&gt;From Creation to Publishing&lt;/defaultValue&gt; &lt;/attributeValuePreferenceInfo&gt; &lt;/attributeInfo&gt; &lt;/attributeInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;attributeInfoList&gt; &lt;attributeInfo id="519"&gt; &lt;name&gt;Collections Sequence 1&lt;/name&gt; &lt;valueTypeId&gt;1&lt;/valueTypeId&gt;</pre>

### setAttributes

<b>Function</b>	Map ContentType with attributes.		
<b>Description</b>	This request is used to update the attribute mapping of content types and their children with the specified map of attributes.		
<b>Type</b>	POST		
<b>URL Format</b>	.... /admin/contenttypes		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	setAttributes		com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	op=setattributes	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	contentTypes= [comma-separated list of Content Types]	string	Content type IDs or Names.
	attributes= [comma-separated list of attribute names or	string	Attributes IDs or Names.

## REST FRAMEWORK SERVICES

	<b>IDs</b>		
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <pre>http://serverName:serverPort/rest/service/admin/contenttypes? op=setattributes&amp;contenttypes=1000&amp;attributes= 180,305:</pre>		

### getAttribute

<b>Function</b>	Get an attribute with a specific ID or Name.				
<b>Description</b>	This request returns an attribute with the specified ID or Name.				
<b>Type</b>	GET				
<b>URL Format</b>	<code>.../admin/attributes/{attributeIdORattributeName}</code>				
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>			
	<code>getAttribute</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>			
<b>Parameters</b>	This request requires no input parameters.				
<b>Returns</b>	Returns an <code>attributeInfoList</code> object in XML format.				
<b>Examples</b>	<b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/attributes/collection</code>				
	<b>Result:</b>  <code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;attributeInfoList&gt; &lt;attributeInfo id="55"&gt; &lt;name&gt;Collection&lt;/name&gt; &lt;valueTypeId&gt;7&lt;/valueTypeId&gt; &lt;valueType&gt;DOMAIN&lt;/valueType&gt; &lt;userDefined&gt;false&lt;/userDefined&gt; &lt;queryable&gt;false&lt;/queryable&gt; &lt;modificationLevel&gt;USER_MODIFIABLE&lt;/modificationLevel&gt; &lt;creator&gt;1&lt;/creator&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;lastModifier&gt;1&lt;/lastModifier&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;displayable&gt;true&lt;/displayable&gt; &lt;limitedAccess&gt;false&lt;/limitedAccess&gt; &lt;limitedAccessChangeable&gt;false&lt;/limitedAccessChangeable&gt; &lt;constraintsChangeable&gt;false&lt;/constraintsChangeable&gt; &lt;valuePreferencesChangeable&gt;false&lt;/valuePreferencesChangeable&gt; &lt;attributeValuePreferenceInfo&gt; &lt;domainId&gt;19&lt;/domainId&gt; &lt;domainName&gt;Collections&lt;/domainName&gt; &lt;/attributeValuePreferenceInfo&gt; &lt;/attributeInfo&gt; &lt;/attributeInfoList&gt;</code>				

### getAllAttributes

<b>Function</b>	Get all attributes and attribute IDs.		
<b>Description</b>	This request returns all existing attributes with their metadata of QPP Server.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../admin/attributes</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	

	<code>getAllAttributes</code>	<code>com.quark.qpp.service.facade</code> Class AdminFacade
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns an <code>attributeInfoList</code> object containing an array of attributes that exist in the QPP server.	
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/attributes &lt;attributeInfoList&gt; &lt;attributeInfo id="180"&gt; &lt;name&gt;App Studio Issue URN&lt;/name&gt; ..... &lt;/attributeInfo&gt; &lt;attributeInfo id="305"&gt; &lt;name&gt;Article Component id&lt;/name&gt; .....</pre> <p><b>Result:</b></p> <p>An <code>attributeInfoList</code> object containing an array of attributes that exist in the QPP server.</p>	

## updateAttributes

<b>Function</b>	Update attributes.		
<b>Description</b>	This request is used to update the metadata of a single or multiple attributes.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/attributes</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateAttributes</code>		<code>com.quark.qpp.service.facade</code> Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributeinfolist</code>	string	List of attributes to be updated.
<b>Returns</b>	Returns an <code>attributeInfoList</code> object containing a list of successfully updated attributes.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/attributes?op= update&amp;attributevalueList= &lt;attributeInfoList&gt; &lt;attributeInfo id="507"&gt; &lt;name&gt;Release Version&lt;/name&gt; &lt;valueTypeId&gt;5&lt;/valueTypeId&gt; &lt;valueType&gt;MEASUREMENT&lt;/valueType&gt; &lt;userDefined&gt;true&lt;/userDefined&gt; &lt;queryable&gt;true&lt;/queryable&gt; &lt;modificationLevel&gt;USER_MODIFIABLE&lt;/modificationLevel&gt; &lt;displayable&gt;true&lt;/displayable&gt; &lt;limitedAccess&gt;false&lt;/limitedAccess&gt; &lt;limitedAccessChangeable&gt;true&lt;/limitedAccessChangeable&gt; &lt;constraintsChangeable&gt;true&lt;/constraintsChangeable&gt; &lt;valuePreferencesChangeable&gt;true&lt;/valuePreferencesChangeable&gt; &lt;attributeValuePreferenceInfo&gt; &lt;defaultValue&gt;4&lt;/defaultValue&gt; &lt;maximumPossibleValue&gt;7&lt;/maximumPossibleValue&gt; &lt;minimumPossibleValue&gt;2&lt;/minimumPossibleValue&gt; &lt;measurementUnit&gt;10&lt;/measurementUnit&gt; &lt;/attributeValuePreferenceInfo&gt; &lt;/attributeInfo&gt;</pre>		

## REST FRAMEWORK SERVICES

## deleteAttribute

<b>Function</b>	Delete an Attribute.		
<b>Description</b>	This request is used to delete an attribute with the specified id or name.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/attributes/{attributeIdORattributeName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>deleteAttribute</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributeIdORName</code>	long or string	The Name or ID of the attribute to be deleted.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b>		

## REST FRAMEWORK SERVICES

	<code>http://serverName:serverPort/rest/service/admin/attributes/[attributeIdorName] ?op=delete</code>
--	--

### createForms

<b>Function</b>	Create forms.		
<b>Description</b>	This request is used to create a new form in the system.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.... /admin/forms</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createForm</code>		<code>com.quark.qpp.service.facade Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>formInfoList</code>	string	List of forms to be created.
<b>Returns</b>	Returns a <code>formInfoList</code> object containing a list of successfully created forms. A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/admin/forms?op=create&amp;formInfoList= &lt;formInfoList&gt; &lt;formInfo&gt; &lt;contentType&gt;Project&lt;/contentType&gt; &lt;workflowName&gt;Quark&lt;/workflowName&gt; &lt;formAttributeList&gt; &lt;formAttribute&gt; &lt;name&gt;Collection Path&lt;/name&gt; &lt;xPos&gt;0&lt;/xPos&gt; &lt;yPos&gt;175&lt;/yPos&gt; &lt;totalWidth&gt;450&lt;/totalWidth&gt; &lt;controlWidth&gt;300&lt;/controlWidth&gt; &lt;labelWidth&gt;150&lt;/labelWidth&gt; &lt;valueType&gt;1&lt;/valueType&gt; &lt;/formAttribute&gt; ..... &lt;/formAttributeList&gt; &lt;/formInfo&gt; &lt;/formInfoList&gt;</code>		
	<b>Result:</b> <code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;formInfoList&gt; &lt;formInfo id="32"&gt; &lt;contentType&gt;Project&lt;/contentType&gt; &lt;workflowId&gt;1102&lt;/workflowId&gt; &lt;workflowName&gt;Quark&lt;/workflowName&gt; &lt;defaultView&gt;false&lt;/defaultView&gt; &lt;formAttributeList&gt; &lt;formAttribute id="57"&gt; &lt;name&gt;Collection Path&lt;/name&gt; &lt;xPos&gt;0&lt;/xPos&gt; &lt;yPos&gt;175&lt;/yPos&gt; &lt;totalWidth&gt;450&lt;/totalWidth&gt; &lt;controlWidth&gt;300&lt;/controlWidth&gt; &lt;labelWidth&gt;150&lt;/labelWidth&gt; &lt;valueType&gt;1&lt;/valueType&gt; &lt;/formAttribute&gt; ..... &lt;/formAttributeList&gt; &lt;/formInfo&gt; &lt;/formInfoList&gt;</code>		

### getAllForms

<b>Function</b>	Get all forms.
<b>Description</b>	This request is used to get all forms saved in the system.
<b>Type</b>	GET
<b>URL Format</b>	<code>.... /admin/forms</code>

<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	getAllForms	com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	This request requires no input parameters	
<b>Returns</b>	Returns a <code>formInfoList</code> object containing a list of all the forms.	
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/forms</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;formInfoList&gt; &lt;formInfo id="58"&gt; &lt;contentTypeId&gt;1413&lt;/contentTypeId&gt; &lt;contentTypeName&gt;Project&lt;/contentTypeName&gt; &lt;workflowId&gt;0&lt;/workflowId&gt; &lt;defaultView&gt;false&lt;/defaultView&gt; &lt;formAttributeList&gt; &lt;formAttribute id="57"&gt; &lt;name&gt;Collection Path&lt;/name&gt; &lt;xPos&gt;0&lt;/xPos&gt; &lt;yPos&gt;0&lt;/yPos&gt; &lt;totalWidth&gt;450&lt;/totalWidth&gt; &lt;controlWidth&gt;300&lt;/controlWidth&gt; &lt;labelWidth&gt;150&lt;/labelWidth&gt; &lt;valueType&gt;1&lt;/valueType&gt; &lt;/formAttribute&gt; ..... &lt;/formAttributeList&gt; &lt;/formInfo&gt; ..... &lt;/formInfoList&gt;</pre>	

<b>Function</b>	Get forms with a specific workflow		
<b>Description</b>	This request returns all forms specific to given workflow.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.... /admin/forms</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	getAllForms	com.quark.qpp.service.facade Class AdminFacade	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	workflow	string	ID or name of the workflow.
<b>Returns</b>	Returns a <code>formInfoList</code> object containing a list of all the forms specific to a given workflow.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/forms?workflow=Quark</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;formInfoList&gt; &lt;formInfo id="53"&gt; &lt;contentTypeId&gt;1100&lt;/contentTypeId&gt; &lt;contentTypeName&gt;Asset&lt;/contentTypeName&gt; &lt;workflowId&gt;11&lt;/workflowId&gt; &lt;workflowName&gt;Quark&lt;/workflowName&gt; &lt;defaultView&gt;false&lt;/defaultView&gt; &lt;formAttributeList&gt; &lt;formAttribute id="34"&gt; &lt;name&gt;Checkedout Application&lt;/name&gt; &lt;xPos&gt;0&lt;/xPos&gt; &lt;yPos&gt;0&lt;/yPos&gt; &lt;totalWidth&gt;450&lt;/totalWidth&gt; &lt;controlWidth&gt;314&lt;/controlWidth&gt; &lt;labelWidth&gt;154&lt;/labelWidth&gt; &lt;valueType&gt;1&lt;/valueType&gt; ..... &lt;/formAttributeList&gt; &lt;/formInfo&gt; &lt;/formInfoList&gt;</pre>		

<b>Function</b>	Get forms with a specific content type.
-----------------	---

## REST FRAMEWORK SERVICES

<b>Description</b>	This request is used to get all forms specific to a given content type.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.... /admin/forms</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAllForms</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>contenttype</code>	string	ID or name of the workflow.
<b>Returns</b>	Returns a <code>formInfoList</code> object containing a list of all the forms specific to a given content type.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/forms?workflow=Quark&amp;contenttype=Document</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;formInfoList&gt; &lt;formInfo id="58"&gt; &lt;contentType&gt;1413&lt;/contentType&gt; &lt;contentName&gt;Project&lt;/contentName&gt; &lt;workflowId&gt;0&lt;/workflowId&gt; &lt;defaultView&gt;false&lt;/defaultView&gt; &lt;formAttributeList&gt; &lt;formAttribute id="57"&gt; &lt;name&gt;Collection Path&lt;/name&gt; &lt;xPos&gt;0&lt;/xPos&gt; &lt;yPos&gt;0&lt;/yPos&gt; &lt;totalWidth&gt;450&lt;/totalWidth&gt; &lt;controlWidth&gt;300&lt;/controlWidth&gt; &lt;labelWidth&gt;150&lt;/labelWidth&gt; &lt;valueType&gt;1&lt;/valueType&gt; &lt;/formAttribute&gt; ..... &lt;/formAttributeList&gt; &lt;/formInfo&gt; ..... &lt;/formInfoList&gt;&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;formInfoList&gt; &lt;formInfo id="54"&gt; &lt;contentType&gt;1101&lt;/contentType&gt; &lt;contentName&gt;Document&lt;/contentName&gt; &lt;workflowId&gt;11&lt;/workflowId&gt; &lt;workflowName&gt;Quark&lt;/workflowName&gt; &lt;defaultView&gt;false&lt;/defaultView&gt; &lt;formAttributeList&gt; &lt;formAttribute id="13"&gt; &lt;name&gt;Is checked out&lt;/name&gt; &lt;xPos&gt;0&lt;/xPos&gt; &lt;yPos&gt;184.97&lt;/yPos&gt; &lt;totalWidth&gt;457&lt;/totalWidth&gt; &lt;controlWidth&gt;304.6666666666663&lt;/controlWidth&gt; &lt;labelWidth&gt;154&lt;/labelWidth&gt; &lt;valueType&gt;6&lt;/valueType&gt; &lt;/formAttribute&gt; ..... &lt;/formAttributeList&gt; &lt;/formInfo&gt; &lt;/formInfoList&gt;</pre>		

## updateForms

<b>Function</b>	Update forms.		
<b>Description</b>	This request is used to updates metadata of a single or multiple forms at one time.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.... /admin/forms</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateForms</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify

		which operation is to be performed. (Mandatory)
	forminfoList	string
Returns	Returns a <code>formInfoList</code> object containing a list of all the forms specific to a given workflow.	
<b>URL:</b>		<pre>http://serverName:serverPort/rest/service/admin/forms?op=update&amp;forminfoList= &lt;formInfoList&gt;   &lt;formInfo&gt;     &lt;contentTypeName&gt;Document&lt;/contentTypeName&gt;     &lt;workflowName&gt;Quark&lt;/workflowName&gt;     &lt;formAttributeList&gt;       &lt;formAttribute id="13"&gt;         &lt;name&gt;Is checked out&lt;/name&gt;         &lt;xPos&gt;0&lt;/xPos&gt;         &lt;yPos&gt;184.97&lt;/yPos&gt;         &lt;totalWidth&gt;457&lt;/totalWidth&gt;         &lt;controlWidth&gt;304.666666666663&lt;/controlWidth&gt;         &lt;labelWidth&gt;154&lt;/labelWidth&gt;         &lt;valueType&gt;6&lt;/valueType&gt;       &lt;/formAttribute&gt;     &lt;/formAttributeList&gt;   &lt;/formInfo&gt; &lt;/formInfoList&gt;</pre>
<b>Result:</b>		<pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;formInfoList&gt;   &lt;formInfo id="11"&gt;     &lt;contentTypeId&gt;1101&lt;/contentTypeId&gt;     &lt;contentTypeName&gt;Document&lt;/contentTypeName&gt;     &lt;workflowId&gt;10&lt;/workflowId&gt;     &lt;workflowName&gt;Quark&lt;/workflowName&gt;     &lt;defaultView&gt;false&lt;/defaultView&gt;     &lt;formAttributeList&gt;       &lt;formAttribute id="13"&gt;         &lt;name&gt;Is checked out&lt;/name&gt;         &lt;xPos&gt;0&lt;/xPos&gt;         &lt;yPos&gt;184.97&lt;/yPos&gt;         &lt;totalWidth&gt;457&lt;/totalWidth&gt;         &lt;controlWidth&gt;304.666666666663&lt;/controlWidth&gt;         &lt;labelWidth&gt;154&lt;/labelWidth&gt;         &lt;valueType&gt;6&lt;/valueType&gt;       &lt;/formAttribute&gt;     &lt;/formAttributeList&gt;   &lt;/formInfo&gt; &lt;/formInfoList&gt;</pre>
Examples	<b>Example with multiple forms to update</b>	
<b>URL:</b>		<pre>http://serverName:serverPort/rest/service/admin/forms?op=update&amp;forminfoList= &lt;formInfoList&gt;   &lt;formInfo id="91"&gt;     &lt;contentTypeId&gt;10004&lt;/contentTypeId&gt;     &lt;contentTypeName&gt;Archive&lt;/contentTypeName&gt;     &lt;workflowId&gt;0&lt;/workflowId&gt;     &lt;defaultView&gt;false&lt;/defaultView&gt;     &lt;formAttributeList&gt;       &lt;formAttribute id="501"&gt;</pre>

```

```

**deleteForm**

Function	Delete a form.		
Description	This request is used to delete the specified form.		
Type	POST		
URL Format	<code>.... /admin/forms</code>		
Java API	Method Name		Class Name
	<code>deleteForm</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p><b>URL:</b></p> <code>http://serverName:serverPort/rest/service/admin/forms?op=delete&amp;w</code> <code>orkflow=Quark&amp;contenttype=Document</code>		

**createRoles**

Function	Create roles.		
Description	This request is used to create one or more roles/userclass in a single request.		
Type	POST		
URL Format	<code>.... /admin/roles</code>		
Java API	Method Name		Class Name
	<code>createRoles</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>roleInfoList =&lt;xml/&gt;</code>		Object containing a list of the roles to be created. See the <code>roleInfoList</code> paramater in " <a href="#">Request/Response parameter formats</a> ".
Returns	Returns a <code>roleInfoList</code> object containing containing a list of the successfully created roles.		
Examples	<p><b>URL:</b></p> <code>http://serverName:serverPort/rest/service/admin/roles?op=creat</code> <code>e&amp;roleInfoList= &lt;roleInfoList&gt; &lt;roleInfo id="11" name="Updated</code> <code>Name of Role"&gt; &lt;applicationPrivList&gt; &lt;privilege</code> <code>id="190000017"&gt; &lt;name&gt;Remove Link with Collection</code> <code>Template&lt;/name&gt; &lt;/privilege&gt; &lt;privilege id="999991"&gt;</code> <code>&lt;name&gt;Live Preview&lt;/name&gt; &lt;/privilege&gt; ....</code> <code>&lt;/applicationPrivList&gt; &lt;contentTypePrivList&gt; &lt;contentTypePriv</code> <code>contentId="1100"</code>		

	<pre>contentType="Asset"contentTypeHierarchy="System;Asset;"&gt; &lt;privilege id="10000015"&gt; &lt;name&gt;Get Original Assets&lt;/name&gt; &lt;/privilege&gt; .... &lt;/contentTypePriv&gt; .... &lt;/contentTypePrivList&gt; &lt;/roleInfo&gt; &lt;/roleInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;roleInfoList&gt; &lt;roleInfo id="11" name="Updated Name of Role"&gt; &lt;applicationPrivList&gt; &lt;privilege id="190000017"&gt; &lt;name&gt;Remove Link with Collection Template&lt;/name&gt; &lt;/privilege&gt; &lt;privilege id="999991"&gt; &lt;name&gt;Live Preview&lt;/name&gt; &lt;/privilege&gt; ..... &lt;/applicationPrivList&gt; &lt;contentTypePrivList&gt; &lt;contentTypePriv contentTypeId="1100" contentType="Asset"contentTypeHierarchy="System;Asset;"&gt; &lt;privilege id="10000015"&gt; &lt;name&gt;Get Original Assets&lt;/name&gt; &lt;/privilege&gt; .... &lt;/contentTypePriv&gt; ..... &lt;/contentTypePrivList&gt; &lt;/roleInfo&gt; &lt;/roleInfoList&gt;</pre>
--	---

**getRole**

<b>Function</b>	Get a specific userclass/role.		
<b>Description</b>	This request returns the metadata of specified userclass/role.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>../admin/roles/{roleIdOR roleName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getRole</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>roleId</code> OR <code>roleName</code>	string	The ID or Name of the role to be retrieved.
<b>Returns</b>	Returns a <code>roleInfoList</code> object in XML format.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/roles/Administrat</code> or</p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;roleInfoList&gt; &lt;roleInfo name="Administrator" id="1"&gt; &lt;applicationPrivList&gt; &lt;privilege id="190000016"&gt; &lt;name&gt;Status Based Routings&lt;/name&gt; &lt;/privilege&gt; ..... &lt;/applicationPrivList&gt; &lt;contentTypePrivList&gt; &lt;contentTypePriv contentTypeHierarchy="System;Asset;" contentType="Asset" contentTypeId="1100"&gt; &lt;privilege id="10000015"&gt; &lt;name&gt;Get Original Assets&lt;/name&gt; &lt;/privilege&gt; .... &lt;/contentTypePriv&gt; &lt;contentTypePriv contentTypeHierarchy="System;Asset;Media;Video;" contentType="Video" contentTypeId="1152"&gt; &lt;privilege id="10000015"&gt; &lt;name&gt;Get Original Assets&lt;/name&gt; &lt;/privilege&gt; .... &lt;/contentTypePriv&gt; &lt;/contentTypePrivList&gt; ..... &lt;/roleInfo&gt; &lt;/roleInfoList&gt;</pre>		

**getAllRoles**

<b>Function</b>	Get all userclasses/roles.	
<b>Description</b>	This request returns all the userclasses with its metadata.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../admin/roles</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllRoles</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>roleInfoList</code> object containing an array of all roles that exist on the QPP Server.	
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/admin/roles</code> <b>Result:</b> <code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;</code> <code>&lt;roleInfoList&gt; &lt;roleInfo name="Administrator" id="1"/&gt;</code> <code>&lt;roleInfo name="UserClass2" id="10"/&gt; &lt;/roleInfoList&gt;</code>	

**updateRoles**

<b>Function</b>	Update roles.	
<b>Description</b>	This request is used to update the metadata of a specified single or multiple roles.	
<b>Type</b>	POST	
<b>URL Format</b>	<code>....//admin/roles</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>updateRoles</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>
	<code>op=update</code>	string
	<code>roleinfolist=&lt;xml/&gt;</code>	
<b>Returns</b>	Returns a <code>roleInfoList</code> object containing a list of all the successfully updated roles.	
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/admin/roles?op=update</code> <code>e&amp;roleinfolist= &lt;roleInfoList&gt; &lt;roleInfo id="11" name="Updated</code> <code>Name of Role"&gt; &lt;applicationPrivList&gt; &lt;privilege</code> <code>id="190000017"&gt; &lt;name&gt;Remove Link with Collection</code> <code>Template&lt;/name&gt; &lt;/privilege&gt; &lt;privilege id="999991"&gt;</code> <code>&lt;name&gt;Live Preview&lt;/name&gt; &lt;/privilege&gt; ....</code> <code>&lt;/applicationPrivList&gt; &lt;contentTypePrivList&gt; &lt;contentTypePriv</code> <code>contentTypeId="1100" contentType="Asset"</code>

```

**deleteRole**

<b>Function</b>	Delete a role.		
<b>Description</b>	This request is used to delete the specified role.		
<b>Type</b>	POST		
<b>URL Format</b>	.../admin/roles/{roleIdOrName}		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	deleteRole		com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<b>op=delete</b>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<b>roleIdOrName</b>	string	Id or Name of the role to be deleted.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <a href="http://serverName:serverPort/rest/service/admin/roles/23?op=delete">http://serverName:serverPort/rest/service/admin/roles/23?op=delete</a>		

**createRelationType**

<b>Function</b>	Create Relation Types.		
<b>Description</b>	This request is used to create a single or multiple Relation Types at one time.		
<b>Type</b>	POST		
<b>URL Format</b>	.../admin/relationtypes		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	createRelationTypes		com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<b>op=create</b>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<b>relationtypeinfolist</b>	string	List of relation types to create.
<b>Returns</b>	Returns a <code>relationTypeInfoList</code> object containing a list of successfully created relation types.		
<b>Examples</b>	<b>URL:</b> <a href='http://serverName:serverPort/rest/service/admin/relationtypes?op=create&amp;relationtypeinfolist= &lt;relationTypeInfoList&gt;&lt;relationTypeInfo&gt; &lt;name&gt;Private Relations&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;checkOutMandatory&gt;true&lt;/checkOutMandatory&gt; &lt;relationAttributeList&gt; &lt;relationAttribute valueMandatory="false" userMapped="true" id="508"&gt; Master DT &lt;/relationAttribute&gt; &lt;relationAttribute valueMandatory="false" userMapped="true" id="509"&gt; Master List &lt;/relationAttribute&gt;'>http://serverName:serverPort/rest/service/admin/relationtypes?op=create&amp;relationtypeinfolist= &lt;relationTypeInfoList&gt;&lt;relationTypeInfo&gt; &lt;name&gt;Private Relations&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;checkOutMandatory&gt;true&lt;/checkOutMandatory&gt; &lt;relationAttributeList&gt; &lt;relationAttribute valueMandatory="false" userMapped="true" id="508"&gt; Master DT &lt;/relationAttribute&gt; &lt;relationAttribute valueMandatory="false" userMapped="true" id="509"&gt; Master List &lt;/relationAttribute&gt;</a>

## getRelationType

Function	Get Relation Type.
----------	--------------------

<b>Description</b>	This request is used to get the metadata of a specified relation type.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../admin/relationtypes/{relationTypeIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getRelationType</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>relationTypeIdOrName</code>	<code>string</code>	The ID or name of the relation type that is to be retrieved.
<b>Returns</b>	Returns a <code>relationTypeInfoList</code> object containing the metadata of the specified relation type.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/relationtypes/1</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;relationTypeInfoList&gt; &lt;relationTypeInfo id="1"&gt; &lt;name&gt;Primary Attachment&lt;/name&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;checkOutMandatory&gt;true&lt;/checkOutMandatory&gt; &lt;relationAttributeList&gt; &lt;relationAttribute valueMandatory="false" userMapped="false" id="416"&gt; Article Component Reference Asset Minor version &lt;/relationAttribute&gt; &lt;relationAttribute valueMandatory="false" userMapped="false" id="415"&gt; Article Component Reference Asset Major Version &lt;/relationAttribute&gt; .... &lt;/relationAttributeList&gt; &lt;/relationTypeInfo&gt; &lt;/relationTypeInfoList&gt;</pre>		

## getAllRelationTypes

<b>Function</b>	Get all relationship types.		
<b>Description</b>	This request returns all the relation types with their attributes.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../admin/relationtypes</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAllRelationTypes</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters.		
<b>Returns</b>	Returns a <code>relationTypeInfoList</code> object containing an array of all relation types that exist on the QPP Server.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/relationtypes</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;relationTypeInfoList&gt; &lt;relationTypeInfo id="1"&gt; &lt;name&gt;Primary Attachment&lt;/name&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;checkOutMandatory&gt;true&lt;/checkOutMandatory&gt; &lt;relationAttributeList&gt; &lt;relationAttribute</pre>		

	<pre> valueMandatory="false" userMapped="false" id="416"&gt;&gt; Article Component Reference Asset Minor version&lt;/relationAttribute&gt; &lt;relationAttribute valueMandatory="false" userMapped="false" id="414"&gt; Article Component Reference Asset Id&lt;/relationAttribute&gt; ..... &lt;/relationAttributeList&gt; &lt;/relationTypeInfo&gt; &lt;relationTypeInfo id="2"&gt; &lt;name&gt;Secondary Attachment&lt;/name&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;checkOutMandatory&gt;true&lt;/checkOutMandatory&gt; &lt;relationAttributeList&gt; &lt;relationAttribute valueMandatory="false" userMapped="false" id="415"&gt; Article Component Reference Asset Major Version&lt;/relationAttribute&gt; &lt;relationAttribute valueMandatory="false" userMapped="false" id="416"&gt; Article Component Reference Asset Minor version&lt;/relationAttribute&gt; &lt;relationAttribute valueMandatory="false" userMapped="false" id="413"&gt; Article Id&lt;/relationAttribute&gt; ..... &lt;/relationAttributeList&gt; &lt;/relationTypeInfo&gt; .... &lt;/relationTypeInfoList&gt; </pre>

### updateRelationTypes

<b>Function</b>	Update relation types.		
<b>Description</b>	This request is used to update the metadata of user defined relation types.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/relationtypes</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateRelationTypes</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>relationtypeinfolist</code>	string	List of relation types to be updated.
<b>Returns</b>	Returns a <code>relationTypeInfoList</code> object containing a list of successfully updated relation types.		
<b>Examples</b>	<p><b>URL:</b></p> <pre> http://serverName:serverPort/rest/service/admin/relationtypes? op=update&amp;relationtypeinfolist= &lt;relationTypeInfoList&gt; &lt;relationTypeInfo id="1000"&gt; &lt;name&gt;Custom Relations Updated&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;checkOutMandatory&gt;false&lt;/checkOutMandatory&gt; &lt;relationAttributeList&gt; &lt;relationAttribute valueMandatory="false" userMapped="true" id="507"&gt; Release Points &lt;/relationAttribute&gt; &lt;relationAttribute valueMandatory="false" userMapped="true" id="506"&gt; Release Inches Decimal &lt;/relationAttribute&gt; ..... &lt;/relationAttributeList&gt; &lt;/relationTypeInfo&gt; &lt;/relationTypeInfoList&gt; </pre> <p><b>Result:</b></p> <pre> &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;relationTypeInfoList&gt; &lt;relationTypeInfo id="1000"&gt; &lt;name&gt;Custom Relations Updated&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;checkOutMandatory&gt;false&lt;/checkOutMandatory&gt; </pre>		

	<pre>&lt;relationAttributeList&gt; &lt;relationAttribute valueMandatory="false" userMapped="true" id="507"&gt; Release Points &lt;/relationAttribute&gt; &lt;relationAttribute valueMandatory="false" userMapped="true" id="506"&gt; Release Inches Decimal &lt;/relationAttribute&gt; ..... &lt;/relationAttributeList&gt; &lt;/relationTypeInfo&gt; &lt;/relationTypeInfoList&gt;</pre> <p><b>Example with multiple relation types to update</b></p> <p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/relationtypes? op=update&amp;relationtypeinfoList= &lt;relationTypeInfoList&gt; &lt;relationTypeInfo&gt; &lt;name&gt;demo relation 1&lt;/name&gt; &lt;checkOutMandatory&gt;true&lt;/checkOutMandatory&gt; &lt;/relationTypeInfo&gt; &lt;relationTypeInfo&gt; &lt;name&gt;demo relation 2&lt;/name&gt; &lt;checkOutMandatory&gt;true&lt;/checkOutMandatory&gt; &lt;/relationTypeInfo&gt; .... &lt;/relationTypeInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;relationTypeInfoList&gt; &lt;relationTypeInfo id="1011"&gt; &lt;name&gt;demo relation 1&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;checkOutMandatory&gt;true&lt;/checkOutMandatory&gt; &lt;/relationTypeInfo&gt; &lt;relationTypeInfo id="1012"&gt; &lt;name&gt;demo relation 2&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;checkOutMandatory&gt;true&lt;/checkOutMandatory&gt; &lt;/relationTypeInfo&gt; .... &lt;/relationTypeInfoList&gt;</pre>
--	--

### deleteRelationType

<b>Function</b>	Delete a Relation Type.		
<b>Description</b>	This request is used to delete a relation type with the specified id or name.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/relationtypes/{relationTypeIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>deleteRelationType</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>relationTypeORName</code>	long or string	List of forms to be updated.The Name or ID of the relation type to be deleted.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b>		
	<code>http://serverName:serverPort/rest/service/admin/relationtypes/100</code> <code>0?op=delete</code>		

### createDomains

<b>Function</b>	Create Attribute Domains.
-----------------	---------------------------

## REST FRAMEWORK SERVICES

<b>Description</b>	This request is used to create a single or multiple attribute domains at one time.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/domains</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createDomains</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributedomaininfolist</code>	string	List of attribute domains to create.
<b>Returns</b>	Returns a <code>attributeDomainInfoList</code> object containing a list of successfully created attribute domains.		
<b>Examples</b>	<b>URL:</b>		
	<pre><code>http://serverName:serverPort/rest/service/admin/domains?op=create&amp;attributedomaininfolist= &lt;attributeDomainInfoList&gt; &lt;attributeDomainInfo&gt; &lt;name&gt;Domain 1&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;userModifiable&gt;true&lt;/userModifiable&gt; &lt;itemsSorted&gt;true&lt;/itemsSorted&gt; &lt;expandable&gt;true&lt;/expandable&gt; &lt;warnBeforeExpansion&gt;false&lt;/warnBeforeExpansion&gt; &lt;domainValueList&gt; &lt;nameId&gt; &lt;name&gt;Value 1&lt;/name&gt; &lt;/nameId&gt; &lt;/domainValueList&gt; &lt;/attributeDomainInfo&gt; &lt;/attributeDomainInfoList&gt;</code></pre>		
	<b>Result:</b>		
	<pre><code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;attributeDomainInfoList&gt; &lt;attributeDomainInfo id="504"&gt; &lt;name&gt;Domain 1&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;userModifiable&gt;true&lt;/userModifiable&gt; &lt;itemsSorted&gt;true&lt;/itemsSorted&gt; &lt;expandable&gt;true&lt;/expandable&gt; &lt;warnBeforeExpansion&gt;false&lt;/warnBeforeExpansion&gt; &lt;domainValueList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Value 1&lt;/name&gt; &lt;/nameId&gt; &lt;/domainValueList&gt; &lt;/attributeDomainInfo&gt; &lt;/attributeDomainInfoList&gt;</code></pre>		
	<b>Example with multiple domains</b>		
<b>URL:</b>			
	<pre><code>http://serverName:serverPort/rest/service/admin/domains?op=create&amp;attributedomaininfolist= &lt;attributeDomainInfoList&gt; &lt;attributeDomainInfo&gt; &lt;name&gt;Domain 1&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;userModifiable&gt;true&lt;/userModifiable&gt; &lt;itemsSorted&gt;true&lt;/itemsSorted&gt; &lt;expandable&gt;true&lt;/expandable&gt; &lt;warnBeforeExpansion&gt;false&lt;/warnBeforeExpansion&gt; &lt;domainValueList&gt; &lt;nameId&gt; &lt;name&gt;Value 1&lt;/name&gt; &lt;/nameId&gt; &lt;/domainValueList&gt; &lt;/attributeDomainInfo&gt; &lt;attributeDomainInfo&gt; &lt;name&gt;Domain 2&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;userModifiable&gt;true&lt;/userModifiable&gt; &lt;itemsSorted&gt;true&lt;/itemsSorted&gt; &lt;expandable&gt;true&lt;/expandable&gt; &lt;warnBeforeExpansion&gt;true&lt;/warnBeforeExpansion&gt; &lt;domainValueList&gt; &lt;nameId&gt; &lt;name&gt;Value 1&lt;/name&gt; &lt;/nameId&gt; &lt;/domainValueList&gt; &lt;/attributeDomainInfo&gt; &lt;/attributeDomainInfoList&gt;</code></pre>		

	<p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;attributeDomainInfoList&gt; &lt;attributeDomainInfo id="502"&gt; &lt;name&gt;Domain 1&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;userModifiable&gt;true&lt;/userModifiable&gt; &lt;itemsSorted&gt;true&lt;/itemsSorted&gt; &lt;expandable&gt;true&lt;/expandable&gt; &lt;warnBeforeExpansion&gt;false&lt;/warnBeforeExpansion&gt; &lt;domainValueList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Value 1&lt;/name&gt; &lt;/nameId&gt; &lt;/domainValueList&gt; &lt;/attributeDomainInfo&gt; &lt;attributeDomainInfo id="503"&gt; &lt;name&gt;Domain 2&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;userModifiable&gt;true&lt;/userModifiable&gt; &lt;itemsSorted&gt;true&lt;/itemsSorted&gt; &lt;expandable&gt;true&lt;/expandable&gt; &lt;warnBeforeExpansion&gt;true&lt;/warnBeforeExpansion&gt; &lt;domainValueList&gt; &lt;nameId id="2"&gt; &lt;name&gt;Value 1&lt;/name&gt; &lt;/nameId&gt; &lt;/domainValueList&gt; &lt;/attributeDomainInfo&gt; &lt;/attributeDomainInfoList&gt;</pre>
--	--

### getDomain

<b>Function</b>	Get Attribute Domain.		
<b>Description</b>	This request is used to get the metadata of a specified attribute domain.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>....admin/domains/{domainIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getDomain</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>domainTypeIdOrName</code>	<code>string</code>	The ID or name of the domain that is to be retrieved.
<b>Returns</b>	Returns an <code>attributeDomainInfoList</code> object containing the metadata of the specified domain.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/domains/3</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;attributeDomainInfoList&gt; &lt;attributeDomainInfo id="3"&gt; &lt;name&gt;Users&lt;/name&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;userModifiable&gt;false&lt;/userModifiable&gt; &lt;itemsSorted&gt;true&lt;/itemsSorted&gt; &lt;expandable&gt;false&lt;/expandable&gt; &lt;warnBeforeExpansion&gt;false&lt;/warnBeforeExpansion&gt; &lt;domainValueList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; &lt;valueHierarchy&gt;Desktop&lt;/valueHierarchy&gt; ..... &lt;/domainValueList&gt; &lt;/attributeDomainInfo&gt; ..... &lt;/attributeDomainInfoList&gt;</pre>		

### getAllDomains

<b>Function</b>	Get all attribute domains.
<b>Description</b>	This request is used to get the metadata of all the domains that exist in the system.

## REST FRAMEWORK SERVICES

Type	GET	
URL Format	.../admin/domains	
Java API	Method Name	Class Name
	getAllDomains	com.quark.qpp.service.facade Class AdminFacade
Parameters	This request requires no input parameters.	
Returns	Returns an attributeDomainInfoList object containing the metadata of all the attribute domains.	
Examples	<p><b>URL:</b>  <a href="http://serverName:serverPort/rest/service/admin/domains">http://serverName:serverPort/rest/service/admin/domains</a></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;attributeDomainInfoList&gt; &lt;attributeDomainInfo id="3"&gt; &lt;name&gt;Users&lt;/name&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;userModifiable&gt;false&lt;/userModifiable&gt; &lt;itemsSorted&gt;true&lt;/itemsSorted&gt; &lt;expandable&gt;false&lt;/expandable&gt; &lt;warnBeforeExpansion&gt;false&lt;/warnBeforeExpansion&gt; &lt;domainValueList&gt; &lt;nameId id="1"&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;/nameId&gt; &lt;valueHierarchy&gt;Desktop&lt;/valueHierarchy&gt; ..... &lt;/domainValueList&gt; &lt;/attributeDomainInfo&gt; ..... &lt;/attributeDomainInfoList&gt;</pre>	

### updateDomains

Function	Update attribute domains.	
Description	This request is used to update the metadata of a single or multiple attribute domains.	
Type	POST	
URL Format	.../admin/domains	
Java API	Method Name	Class Name
	updateDomains	com.quark.qpp.service.facade Class AdminFacade
Parameters	Name	Type
	op=update	string
	attributedomaininfolist	string
Returns	Returns an attributeDomainInfoList object containing a list of successfully updated domains.	
Examples	<p><b>URL:</b>  <a &lt;itemssorted&gt;false&lt;="" &lt;name&gt;domain="" &lt;systemdefined&gt;false&lt;="" &lt;usermodifiable&gt;true&lt;="" 1&lt;="" 503"&gt;="" href="http://serverName:serverPort/rest/service/admin/domains?op=update&amp;attributedomaininfolist= &lt;attributeDomainInfoList&gt; &lt;attributeDomainInfo id=" itemssorted&gt;"="" name&gt;="" systemdefined&gt;="" usermodifiable&gt;="">http://serverName:serverPort/rest/service/admin/domains?op=update&amp;attributedomaininfolist= &lt;attributeDomainInfoList&gt; &lt;attributeDomainInfo id="503"&gt; &lt;name&gt;Domain 1&lt;/name&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;userModifiable&gt;true&lt;/userModifiable&gt; &lt;itemsSorted&gt;false&lt;/itemsSorted&gt;</a></p>	

```

<expandable>false</expandable>
<warnBeforeExpansion>false</warnBeforeExpansion>
<domainValueList> <nameId id="1"> <name>Value 1</name>
</nameId> </domainValueList> </attributeDomainInfo>
</attributeDomainInfoList>

```

### Result:

```

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<attributeDomainInfoList> <attributeDomainInfo id="503">
<name>Domain 1</name> <systemDefined>false</systemDefined>
<userModifiable>true</userModifiable>
<itemsSorted>false</itemsSorted>
<expandable>false</expandable>
<warnBeforeExpansion>false</warnBeforeExpansion>
<domainValueList> <nameId id="1"> <name>Value 1</name>
</nameId> </domainValueList> </attributeDomainInfo>
</attributeDomainInfoList>

```

### Example with multiple attribute domains to update

#### URL:

```

http://serverName:serverPort/rest/service/admin/domains?op=update&attributedomaininfoList= <attributeDomainInfoList>
<attributeDomainInfo id="502"> <name>Domain 1</name>
<systemDefined>false</systemDefined>
<userModifiable>true</userModifiable>
<itemsSorted>true</itemsSorted> <expandable>true</expandable>
<warnBeforeExpansion>false</warnBeforeExpansion>
<domainValueList> <nameId id="1"> <name>Value 1</name>
</nameId> </domainValueList> </attributeDomainInfo>
<attributeDomainInfo id="503"> <name>Domain 2</name>
<systemDefined>false</systemDefined>
<userModifiable>true</userModifiable>
<itemsSorted>true</itemsSorted> <expandable>true</expandable>
<warnBeforeExpansion>true</warnBeforeExpansion>
<domainValueList> <nameId id="2"> <name>Value 1</name>
</nameId> </domainValueList> </attributeDomainInfo>
</attributeDomainInfoList>

```

### Result:

```

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<attributeDomainInfoList> <attributeDomainInfo id="502">
<name>Domain 1</name> <systemDefined>false</systemDefined>
<userModifiable>true</userModifiable>
<itemsSorted>true</itemsSorted> <expandable>true</expandable>
<warnBeforeExpansion>false</warnBeforeExpansion>
<domainValueList> <nameId id="1"> <name>Value 1</name>
</nameId> </domainValueList> </attributeDomainInfo>
<attributeDomainInfo id="503"> <name>Domain 2</name>
<systemDefined>false</systemDefined>
<userModifiable>true</userModifiable>
<itemsSorted>true</itemsSorted> <expandable>true</expandable>
<warnBeforeExpansion>true</warnBeforeExpansion>
<domainValueList> <nameId id="2"> <name>Value 1</name>
</nameId> </domainValueList> </attributeDomainInfo>
</attributeDomainInfoList>

```

## **deleteDomain**

<b>Function</b>	Delete an Attribute Domain.
<b>Description</b>	This request is used to delete an attribute domain with the specified id or name.

## REST FRAMEWORK SERVICES

Type	POST		
URL Format	<code>.... /admin/domains/{domainIdOrName}</code>		
Java API	Method Name		Class Name
	<code>deleteDomain</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Parameters	<code>domainIdOrName</code>	long or string	The Name or ID of the domain to be deleted.
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p>URL:</p> <p><code>http://serverName:serverPort/rest/service/admin/domains/503?op=delete</code></p>		

### createLdapProfiles

Function	Create LDAP profiles.		
Description	This request is used to create one or more LDAP profiles.		
Type	POST		
URL Format	<code>.... /admin/ldaprofiles</code>		
Java API	Method Name		Class Name
	<code>createLdapProfiles</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Parameters	<code>ldapProfileInfoList = &lt;xml/&gt;</code>		Object containing a list of the LDAP profiles to be created.
Returns	Returns a <code>ldapProfileInfoList</code> object containing the successfully created LDAP profiles.		
Examples	<p>URL:</p> <pre>http://serverName:serverPort/rest/service/admin/ldaprofiles?op=create&amp;ldapProfileInfoList= &lt;ldapProfileInfoList&gt; &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;ldapProfileInfoList&gt; &lt;ldapProfileInfo&gt; &lt;name&gt;QPP LDAP Profile&lt;/name&gt; &lt;realm&gt;INDIA.QUARK.COM&lt;/realm&gt; &lt;userName&gt;qppadmin@quark.com&lt;/userName&gt; &lt;authenticationType&gt;KERBEROS&lt;/authenticationType&gt; &lt;ldapServerInfoList&gt; &lt;ldapServerInfo&gt; &lt;scheme&gt;LDAP&lt;/scheme&gt; &lt;serverName&gt;india-dc1.india.quark.com&lt;/serverName&gt; &lt;port&gt;389&lt;/port&gt; &lt;/ldapServerInfo&gt; &lt;/ldapServerInfoList&gt; &lt;ldapObjectsIdentificationCriteria&gt; &lt;userIdentificationCriteria&gt; ... &lt;/userIdentificationCriteria&gt;</pre>		

```

--	--

### getLdapProfile

<b>Function</b>	Get an LDAP profile.		
<b>Description</b>	This request returns the metadata of a specified LDAP profile.		
<b>Type</b>	Get		
<b>URL Format</b>	<code>.../admin/ldaprofiles/{ldapProfileIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getLdapProfile</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>ldapProfileIdOrName</code>	<code>string</code>	The ID or Name of the LDAP profile to be retrieved.
<b>Returns</b>	Returns a <code>ldapProfileInfoList</code> object containing information on the specified LDAP profile.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/ldaprofiles/10</code></p> <p><b>Result:</b></p> <pre> &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;ldapProfileInfoList&gt; &lt;ldapProfileInfo id="10"&gt; &lt;name&gt;QPP LDAP Profile&lt;/name&gt; &lt;realm&gt;INDIA.QUARK.COM&lt;/realm&gt; &lt;userName&gt;qppadmin@quark.com&lt;/userName&gt; &lt;authenticationType&gt;KERBEROS&lt;/authenticationType&gt; &lt;ldapServerInfoList&gt; &lt;ldapServerInfo&gt; &lt;scheme&gt;LDAP&lt;/scheme&gt; &lt;serverName&gt;india-dc1.india.quark.com&lt;/serverName&gt; &lt;port&gt;389&lt;/port&gt; &lt;/ldapServerInfo&gt; &lt;/ldapServerInfoList&gt; &lt;ldapObjectsIdentificationCriteria&gt; &lt;userIdentificationCriteria&gt; ... &lt;/userIdentificationCriteria&gt; &lt;groupIdentificationCriteria&gt; ... &lt;/groupIdentificationCriteria&gt; &lt;groupMemberAttrName&gt;member&lt;/groupMemberAttrName&gt; &lt;membershipIdentifyingAttrName&gt;memberof&lt;/membershipIdentifying AttrName&gt; &lt;baseDn&gt;BDN&lt;/baseDn&gt; &lt;filterToGetAllUsersOfGroup&gt; ... &lt;/filterToGetAllUsersOfGroup&gt; &lt;filterToGetAllSubGroupsOfGroup&gt; ... &lt;/filterToGetAllSubGroupsOfGroup&gt; &lt;filterToGetAllGroupsOfUser&gt; ... &lt;/filterToGetAllGroupsOfUser&gt; &lt;/ldapObjectsIdentificationCriteria&gt; &lt;ldapAttributeInfoList&gt; &lt;ldapAttributeInfo id="5"&gt; &lt;name&gt;USER_EMAIL&lt;/name&gt; &lt;value&gt;mail&lt;/value&gt; &lt;/ ldapAttributeInfo &gt; ..... &lt;/ldapAttributeInfoList&gt; &lt;/ldapProfileInfo&gt; &lt;/ldapProfileInfoList&gt;</pre>		

## REST FRAMEWORK SERVICES

### getAllLdapProfiles

<b>Function</b>	Get all LDAP profiles.	
<b>Description</b>	This request returns all the LDAP profiles saved on the system.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../admin/ldaprofiles</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllLdapProfiles</code>	<code>com.quark.qpp.service.facade Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters	
<b>Returns</b>	Returns a <code>ldapProfileInfoList</code> object containing a list of all the LDAP profiles that exist on the QPP Server.	
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/workflows</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;ldapProfileInfoList&gt; &lt;ldapProfileInfo id="10"&gt; &lt;name&gt;QPP LDAP Profile&lt;/name&gt; &lt;realm&gt;INDIA.QUARK.COM&lt;/realm&gt; &lt;userName&gt;qppadmin@quark.com&lt;/userName&gt; &lt;authenticationType&gt;KERBEROS&lt;/authenticationType&gt; &lt;ldapServerInfoList&gt; &lt;ldapServerInfo&gt; &lt;schema&gt;LDAP&lt;/schema&gt; &lt;serverName&gt;india-dc1.india.quark.com&lt;/serverName&gt; &lt;port&gt;389&lt;/port&gt; &lt;/ldapServerInfo&gt; &lt;/ldapServerInfoList&gt; &lt;ldapObjectsIdentificationCriteria&gt; &lt;userIdentificationCriteria&gt; ... &lt;/userIdentificationCriteria&gt; &lt;groupIdentificationCriteria&gt; ... &lt;/groupIdentificationCriteria&gt; &lt;groupMemberAttrName&gt;member&lt;/groupMemberAttrName&gt; &lt;membershipIdentifyingAttrName&gt;memberof&lt;/membershipIdentifying AttrName&gt; &lt;baseDn&gt;BDN&lt;/baseDn&gt; &lt;filterToGetAllUsersOfGroup&gt; ... &lt;/filterToGetAllUsersOfGroup&gt; &lt;filterToGetAllSubGroupsOfGroup&gt; ... &lt;/filterToGetAllSubGroupsOfGroup&gt; &lt;filterToGetAllGroupsOfUser&gt; ... &lt;/filterToGetAllGroupsOfUser&gt; &lt;/ldapObjectsIdentificationCriteria&gt; &lt;ldapAttributeInfoList&gt; &lt;ldapAttributeInfo id="5"&gt; &lt;name&gt;USER_EMAIL&lt;/name&gt; &lt;value&gt;mail&lt;/value&gt; &lt;/ ldapAttributeInfo &gt; ..... &lt;/ldapAttributeInfoList&gt; &lt;/ldapProfileInfo&gt; ..... &lt;/ldapProfileInfoList&gt;</pre>	

### updateLdapProfiles

<b>Function</b>	Update LDAP profiles.	
<b>Description</b>	This request is used to update the metadata of a specified single or multiple LDAP profiles.	
<b>Type</b>	POST	
<b>URL Format</b>	<code>.../admin/ldaprofiles</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>updateLdapProfiles</code>	<code>com.quark.qpp.service.facade Class AdminFacade</code>

	Name	Type	Description
Parameters	op=update	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	ldapprofileinfolist=<xml/>		Object containing a list of the successfully updated LDAP profiles.
Returns	Returns a <code>ldapProfileInfoList</code> object containing a list of all the successfully updated LDAP profiles.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/workflows?op=u pdate&amp;workflowinfoList= &lt;workflowInfoList&gt; &lt;workflowInfo id="22"&gt; &lt;name&gt;DefaultWorkflow New&lt;/name&gt; &lt;/workflowInfo&gt; &lt;/workflowInfoList&gt;</pre> <p><b>Result:</b></p> <pre>http://serverName:serverPort/rest/service/admin/ldaprofiles?o p=update&amp;attributevalueList= &lt;ldapProfileInfoList&gt; &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;ldapProfileInfoList&gt; &lt;ldapProfileInfo&gt; &lt;name&gt;QPP LDAP Profile India&lt;/name&gt; &lt;realm&gt;INDIA.QUARK.COM&lt;/realm&gt; &lt;userName&gt;qppadmin@quark.com&lt;/userName&gt; &lt;authenticationType&gt;KERBEROS&lt;/authenticationType&gt; &lt;ldapServerInfoList&gt; &lt;ldapServerInfo&gt; &lt;scheme&gt;LDAP&lt;/scheme&gt; &lt;serverName&gt;india-dc1.india.quark.com&lt;/serverName&gt; &lt;port&gt;389&lt;/port&gt; &lt;/ldapServerInfo&gt; &lt;/ldapServerInfoList&gt; &lt;/ldapProfileInfo&gt;&lt;ldapProfileInfo&gt; &lt;name&gt;QPP LDAP Profile US&lt;/name&gt; &lt;realm&gt;INDIA.QUARK.COM&lt;/realm&gt; &lt;userName&gt;qppadmin@quark.com&lt;/userName&gt; &lt;authenticationType&gt;KERBEROS&lt;/authenticationType&gt; &lt;ldapServerInfoList&gt; &lt;ldapServerInfo&gt; &lt;scheme&gt;LDAP&lt;/scheme&gt; &lt;serverName&gt;india-dc1.india.quark.com&lt;/serverName&gt; &lt;port&gt;389&lt;/port&gt; &lt;/ldapServerInfo&gt; &lt;/ldapServerInfoList&gt; &lt;/ldapProfileInfo&gt; &lt;/ldapProfileInfoList&gt;</pre>		

## deleteLdapProfile

Function	Delete an LDAP profile.		
Description	This request is used to delete the specified LDAP profile from the system. There shouldn't be any LDAP user in the system associated with this profile while executing this request.		
Type	POST		
URL Format	<code>.../admin/ldaprofiles/{profileId}</code>		
Java API	Method Name		Class Name
	<code>deleteLdapProfile</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>ldapProfileIdOrName</code>	string	Id or Name of the LDAP profile to be deleted.

## REST FRAMEWORK SERVICES

<b>Returns</b>	A status of 200 is returned in response to a successful request execution.
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/ldapprofiles/10?op=delete</pre>

### getLdapUsers

<b>Function</b>	Get Ldap users.		
<b>Description</b>	This request returns LDAP users using a saved ldap query id/name or a combination of valid ldapprofile id/name, base string & search filter.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>./admin/ldapusers</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getLdapUsers</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>savedldapquery</code>	string	Specify the name of the LDAP Query. (Mandatory)
	<code>ldapProfile</code>	string	Specify the name of the LDAP profile. (Mandatory)
	<code>baseString</code>	string	Specify the base string to fetch LDAP users.(Mandatory)
	<code>searchFilter</code>	string	Specify the filter to filter the users. (Mandatory)
	<code>defaultUserClass</code>	string	The Quark Publishing Platform Server's UserRole. After fetching users from LDAP Server users will be created with this UserRole. (Mandatory)
	<code>pagesize</code>	string	
<b>Returns</b>	Returns a <code>userInfoList</code> object containing the metadata of the specified users.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/users?savedldapquery=LDAP Search&amp;ldapProfile=QPP LDAP Profile&amp;baseString=ou=users,ou=qmhi,dc=india,dc=quark,dc=com&amp;searchFilter=sn=abc&amp;defaultUserClass=UserClass2</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;userInfoList&gt; &lt;userInfo id="52"&gt; &lt;name&gt;abc&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;user&gt;true&lt;/user&gt; ..... &lt;deleted&gt;false&lt;/deleted&gt; &lt;overriddenUserClassId&gt;0&lt;/overriddenUserClassId&gt; &lt;/userInfo&gt; &lt;userInfo id="53"&gt; &lt;name&gt;abc&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; ..... &lt;/userInfo&gt; &lt;/userInfoList&gt;</pre>		

**importUsersFromLdap**

<b>Function</b>	Import users from LDAP using LDAP profile.		
<b>Description</b>	This request is used to fetch users metadata from LDAP Server and push it to the Quark Publishing Platform Server.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/users</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>importUsersFromLdap</code>		<code>com.quark.qpp.service.facade Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=importusers</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>ldapProfile</code>		Specify the name of the LDAP profile. (Mandatory)
	<code>baseString</code>		Specify the base string to fetch LDAP users. (Mandatory)
	<code>searchFilter</code>		Specify the filter to filter the users. (Mandatory)
	<code>defaultUserClass</code>		The Quark Publishing Platform Server's UserRole. After fetching users from LDAP Server users will be created with this UserRole. (Mandatory)
<b>Returns</b>	Returns a <code>userInfoList</code> object containing metadata of newly fetched\created users in the form of an array.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/admin/users?op=importusers &amp;ldapProfile=QPP LDAP Profile&amp;baseString=ou=users,ou=qmhi,dc=india,dc=quark,dc=com&amp;searchFilter=sn=abc&amp;defaultUserClass=UserClass2</code> <b>Result:</b> <code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;userInfoList&gt; &lt;userInfo id="52"&gt; &lt;name&gt;abc&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;user&gt;true&lt;/user&gt; ..... &lt;deleted&gt;false&lt;/deleted&gt; &lt;overriddenUserClassId&gt;0&lt;/overriddenUserClassId&gt; &lt;/userInfo&gt; &lt;userInfo id="53"&gt; &lt;name&gt;abc&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; ..... &lt;/userInfo&gt; &lt;/userInfoList&gt;</code>		

<b>Function</b>	Import Users from LDAP using Saved Query		
<b>Description</b>	This request is used to fetch users metadata from the LDAP Server and push it to the Quark Publishing Platform Server.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/users</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>importUsersFromLdap</code>		<code>com.quark.qpp.service.facade</code>

			Class AdminFacade
Parameters	Name	Type	Description
	op=importusers	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	Returns a <code>userInfoList</code> object containing metadata of newly fetched\created users in the form of an array.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/users?op=importusers &amp;savedLdapQuery=SavedSearch</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;userInfoList&gt; &lt;userInfo id="52"&gt; &lt;name&gt;abc&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;user&gt;true&lt;/user&gt; ..... &lt;deleted&gt;false&lt;/deleted&gt; &lt;overriddenUserId&gt;0&lt;/overriddenUserId&gt; &lt;/userInfo&gt; &lt;userInfo id="53"&gt; &lt;name&gt;abc&lt;/name&gt; &lt;domainId&gt;0&lt;/domainId&gt; ..... &lt;/userInfo&gt; &lt;/userInfoList&gt;</pre>		

## getLdapGroups

Function	Get LDAP groups.		
Description	This request returns LDAP groups using a saved LDAP query or the combination of basestring, ldaprofile and searchfilter.		
Type	GET		
URL Format	<code>../admin/ldapgroups</code>		
Java API	Method Name		Class Name
	<code>getLdapGroups</code>		<code>com.quark.qpp.service.facade</code> Class AdminFacade
Parameters	Name	Type	Description
	<code>savedLdapquery=[savedLdapQueryId] or [Name]</code>	long	
	<code>ldaprofile=[ldapProfileId] or [Name]</code>	long	
	<code>basestring=[dc=xyz,dc=abc,dc=com]</code>	long	
	<code>searchfilter</code>	string	
Returns	Returns a list of LDAP groups on the basis of a saved LDAP query or the combination of LDAP profile, base string and searchfilter.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/ldapgroups?</pre>		

	<pre>savedldapquery=MySearch</pre> <p><b>Result:</b></p> <pre>&lt;groupInfoList&gt; &lt;groupInfo id="0"&gt; &lt;name&gt;QPP Server&lt;/name&gt; &lt;emailAddress&gt;QPP Server&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;0&lt;/defaultUserClassId&gt; &lt;ldapProfileId&gt;764&lt;/ldapProfileId&gt; &lt;ldapProfile&gt;QPP LDAP Profile&lt;/ldapProfile&gt; &lt;ldapDistinguishedName&gt; CN=QPP Server, OU=DistributionLists, OU=QMHI, DC=india, DC=quark, DC=com &lt;/ldapDistinguishedName&gt; &lt;memberList/&gt; &lt;/groupInfo&gt; &lt;/groupInfoList&gt;</pre>
--	---

## importGroupsFromLdap

<b>Function</b>	Import LDAP groups.		
<b>Description</b>	This request imports groups from the LDAP server along with all of its subgroups and users into Platform Server. An empty string will be the default password for all users imported.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>../admin/groups</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>importGroupsFromLdap</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>savedldapquery=[savedLdapQueryId] or [Name]</code>	long	
	<code>ldapprofile=[ldapProfileId] or [Name]</code>	long	
	<code>basestring=[dc=xyz,dc=abc,dc=com]</code>	long	
	<code>searchfilter</code>	string	
<b>Returns</b>	Returns an <code>importedGroupInfoList</code> object containing a list of LDAP groups on the basis of a saved LDAP query or the combination of LDAP profile, base string and searchfilter.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/ldapgroups? op=importgroups&amp;savedldapquery=MyQuery</pre> <p><b>Result:</b></p> <pre>&lt;importedGroupInfoList&gt; &lt;importedGroupInfo&gt; &lt;groupInfo id="3681"&gt; &lt;name&gt;QPP Server&lt;/name&gt; &lt;emailAddress&gt;QPP Server&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; .... &lt;/groupInfo&gt; &lt;subGroupsInfoList&gt; &lt;groupInfo id="3682"&gt; &lt;name&gt;QPP Server R&amp;D&lt;/name&gt; ..... &lt;/groupInfo&gt; &lt;/subGroupsInfoList&gt; &lt;userInfoList&gt; &lt;userInfo id="3687"&gt; &lt;name&gt;kshankarraaman&lt;/name&gt;</pre>		

	<pre>..... &lt;/userInfo&gt; &lt;userInfo id="3688"&gt; &lt;name&gt;Menon&lt;/name&gt; ..... &lt;/userInfo&gt; &lt;/userInfoList&gt; &lt;/importedGroupInfo&gt; &lt;/importedGroupInfoList&gt;</pre>
--	--

**synchronizeLdapUsersGroups**

<b>Function</b>	Synchronize all LDAP users and groups.		
<b>Description</b>	This request synchronizes all users and groups that were imported from LDAP Server to Platform Server.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>../admin/ldaprofiles</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>synchronizeLdapUsersGroups</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=synchronize</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation will run only for a valid session id.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/admin/ldaprofiles?op=synchronize</code>		

**synchronizeLdapUsersGroupsBasedOnProfile**

<b>Function</b>	Synchronize all LDAP users and groups.		
<b>Description</b>	This request synchronizes all users and groups that were imported from LDAP Server to Platform Server using the given LDAP profile..		
<b>Type</b>	GET		
<b>URL Format</b>	<code>../admin/ldaprofiles/{ldaprofileIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>synchronizeLdapUsersGroupsBase</code> <code>dOnProfile</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=synchronize</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation will run only for a valid session id.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/admin/ldaprofiles/Quark India? op=synchronize</code>		

**createLdapSearches**

<b>Function</b>	Create LDAP search definitions.		
<b>Description</b>	This request creates creates LDAP search definitions.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>../admin/ldapsearchdefinitions/</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createLdapSearches</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation will run only for a valid session id.
	<code>ldapsearchinfolist=&lt;xml/&gt;</code>		See “Request/Response parameter formats.”
<b>Returns</b>	Returns a <code>ldapsearchinfolist</code> object in XML format that contains the metadata of all successfully created LDAP search definitions.		
<b>Examples</b>	<b>URL:</b> <code>https://serverName:serverPort/rest/service/admin/ldapsearchdefinitions?op=create&amp;ldapsearchinfolist=&lt;ldapSearchInfoList&gt; &lt;ldapSearchInfo&gt; &lt;name&gt;Demo groups LDAP search&lt;/name&gt; &lt;ldapSearchCriteria&gt; &lt;ldapProfile&gt;Quark India&lt;/ldapProfile&gt; &lt;searchFilter&gt;cn=qpp cli*&lt;/searchFilter&gt; &lt;baseString&gt;dc=india,dc=quark,dc=com&lt;/baseString&gt; &lt;searchType&gt;GROUPS_SEARCH&lt;/searchType&gt; &lt;/ldapSearchCriteria&gt; &lt;/ldapSearchInfo&gt; &lt;/ldapSearchInfoList&gt;</code>		
	<b>Result:</b> <code>&lt;ldapSearchInfoList&gt; &lt;ldapSearchInfo id="123"&gt; &lt;name&gt;Demo groups LDAP search&lt;/name&gt; &lt;ldapSearchCriteria&gt; &lt;ldapProfile id="18"&gt;Quark India&lt;/ldapProfile&gt; &lt;searchFilter&gt;cn=qpp cli*&lt;/searchFilter&gt; &lt;baseString&gt;dc=india,dc=quark,dc=com&lt;/baseString&gt; &lt;searchType&gt;GROUPS_SEARCH&lt;/searchType&gt; &lt;/ldapSearchCriteria&gt; &lt;/ldapSearchInfo&gt; &lt;/ldapSearchInfoList&gt;</code>		

**getLdapSearch**

<b>Function</b>	Get LDAP search definition.		
<b>Description</b>	This request returns the LDAP search definition for the given search id or name.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>../admin/ldapsearchdefinitions{searchIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getLdapSearch</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters.		
<b>Returns</b>	Returns a <code>ldapSearchInfoList</code> object containing the LDAP search definition for		

## REST FRAMEWORK SERVICES

	the given search id or name.
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/ldapsearchdefinitions/MySearch</pre> <p><b>Result:</b></p> <pre>&lt;ldapSearchInfoList&gt; &lt;ldapSearchInfo id="10"&gt; &lt;name&gt;MySearch&lt;/name&gt; &lt;ldapSearchCriteria&gt; &lt;ldapProfile id="20"&gt;shankar&lt;/ldapProfile&gt; &lt;searchFilter&gt;sn=*gupta&lt;/searchFilter&gt; &lt;baseString&gt;dc=quark,dc=com&lt;/baseString&gt; &lt;searchType id="1"&gt;USERS_SEARCH&lt;/searchType&gt; &lt;/ldapSearchCriteria&gt; &lt;/ldapSearchInfo&gt; &lt;/ldapSearchInfoList&gt;</pre>

### getAllLdapSearches

Function	Get all saved LDAP search definitions.	
Description	This request returns all saved LDAP search definitions.	
Type	GET	
URL Format	<code>.../admin/ldapsearchdefinitions</code>	
Java API	Method Name	Class Name
	<code>getAllLdapSearches</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	This request requires no input parameters.	
Returns	Returns a <code>ldapSearchInfoList</code> object containing a list of <code>ldapSearchInfo</code> objects containing the LDAP search definition.	
Examples	URL:	
		<pre>http://serverName:serverPort/rest/service/admin/ldapsearchdefinitions</pre>
	Result:	
		<pre>&lt;ldapSearchInfoList&gt; &lt;ldapSearchInfo id="438"&gt; &lt;name&gt;LDAP User Search&lt;/name&gt; &lt;ldapSearchCriteria&gt; &lt;ldapProfile id="764"&gt;QPP LDAP Profile&lt;/ldapProfile&gt; &lt;searchFilter&gt;sn=kumar&lt;/searchFilter&gt; &lt;baseString&gt;ou=users,ou=qmhi,dc=india,dc=quark,dc=com&lt;/baseStr ing&gt; &lt;searchType id="1"&gt;USERS_SEARCH&lt;/searchType&gt; &lt;/ldapSearchCriteria&gt; &lt;/ldapSearchInfo&gt; &lt;ldapSearchInfo id="439"&gt; &lt;name&gt;LDAP Group Search&lt;/name&gt; &lt;ldapSearchCriteria&gt; &lt;ldapProfile id="764"&gt;QPP LDAP Profile&lt;/ldapProfile&gt; &lt;searchFilter&gt;cn=qppserver&lt;/searchFilter&gt; &lt;baseString&gt;dc=india,dc=quark,dc=com&lt;/baseString&gt; &lt;searchType id="2"&gt;GROUPS_SEARCH&lt;/searchType&gt; &lt;/ldapSearchCriteria&gt; &lt;/ldapSearchInfo&gt; &lt;/ldapSearchInfoList&gt;</pre>

### updateLdapSearches

Function	Update LDAP search definitions.
Description	This request update the given LDAP search definitions.

Type	POST		
URL Format	<code>../admin/ldapsearchdefinitions/</code>		
Java API	Method Name		Class Name
	<code>updateLdapSearches</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation will run only for a valid session id.
Returns	Returns a <code>ldapsearchinfolist</code> object in XML format that contains the metadata of all successfully updated LDAP search definitions.		
	<p><b>URL:</b></p> <pre>https://serverName:serverPort/rest/service/admin/     ldapsearchdefinitions?op=update&amp;ldapsearchinfolist=     &lt;ldapSearchInfoList&gt; &lt;ldapSearchInfo&gt; &lt;name&gt;Demo groups LDAP     search&lt;/name&gt; &lt;ldapSearchCriteria&gt; &lt;ldapProfile&gt;Quark     India&lt;/ldapProfile&gt; &lt;searchFilter&gt;cn=qpp cli*&lt;/searchFilter&gt;     &lt;baseString&gt;dc=india,dc=quark,dc=com&lt;/baseString&gt;     &lt;searchType&gt;GROUPS_SEARCH&lt;/searchType&gt; &lt;/ldapSearchCriteria&gt;     &lt;/ldapSearchInfo&gt; &lt;/ldapSearchInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;ldapSearchInfoList&gt; &lt;ldapSearchInfo id="123"&gt; &lt;name&gt;Demo     groups LDAP search&lt;/name&gt; &lt;ldapSearchCriteria&gt; &lt;ldapProfile     id="10"&gt;Quark India&lt;/ldapProfile&gt; &lt;searchFilter&gt;cn=qpp     cli*&lt;/searchFilter&gt;     &lt;baseString&gt;dc=india,dc=quark,dc=com&lt;/baseString&gt; &lt;searchType     id="2"&gt;GROUPS_SEARCH&lt;/searchType&gt; &lt;/ldapSearchCriteria&gt;     &lt;/ldapSearchInfo&gt; &lt;/ldapSearchInfoList&gt;</pre>		
Examples			

## deleteLdapSearch

Function	Delete an LDAP search definition.		
Description	This request deletes the given LDAP search definition with the given ID or name.		
Type	POST		
URL Format	<code>../admin/ldapsearchdefinitions/{searchIdOrName}</code>		
Java API	Method Name		Class Name
	<code>deleteLdapSearch</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation will run only for a valid session id.
Returns	A status of 200 is returned in response to a successful request execution.		

<b>Examples</b>	<b>URL:</b> <pre>http://serverName:serverPort/rest/service/admin/ldapsearchdefinitions/ MySearch?op=delete</pre>
-----------------	---

**getTrustee**

<b>Function</b>	Get a trustee (a user or group) with a particular name.	
<b>Description</b>	This request returns all the metadata of a specified trustee.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../admin/trustees/[trustee_name]</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	getTrustee	com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>trusteeInfo</code> object in XML format of specified user or group.	
<b>Examples</b>	<b>URL:</b> <pre>http://serverName:serverPort/rest/service/admin/trustees/Admin</pre> <b>Result:</b> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;trusteeInfo id="1"&gt; &lt;user&gt;true&lt;/user&gt; &lt;deleted&gt;false&lt;/deleted&gt; &lt;name&gt;Admin&lt;/name&gt; &lt;emailAddress&gt;Editors@company.com&lt;/emailAddress&gt; &lt;nativeTrustee&gt;false&lt;/nativeTrustee&gt; &lt;defaultUserClassId&gt;2&lt;/defaultUserClassId&gt; &lt;ldapProfileId&gt;10&lt;/ldapProfileId&gt; &lt;ldapDistinguishedName&gt;Dist Name&lt;/ldapDistinguishedName&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;/trusteeInfo&gt;</pre>	

**updateTrusteeRule**

<b>Function</b>	Update role for the given trustee.		
<b>Description</b>	This request sets the default role for the given trustee (User or Group).		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/trustees/{trusteeIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	updateTrusteeRole	com.quark.qpp.service.facade Class AdminFacade	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=setrole</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation will run only for a valid session id.
	<code>role=[RoleId] or [Name]</code>	string	

	<code>overrideuserclass= [True] or [False]</code>	boolean	This flag is applicable only if the trustee Id provided is that of a group. If true, it will override the userclass of all users belonging to the given group.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/trustees/ John?op=setole&amp;role=Publishers</pre>		

## createWorkflows

<b>Function</b>	Create workflows.		
<b>Description</b>	This request is used to create one or more workflows and their statuses.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/workflows</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createWorkFlows</code>		<code>com.quark.qpp.service.facade</code> Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>workflowInfoList =&lt;xml/&gt;</code>		Object containing a list of the workflows to be created. See the workflowInfoList parameter in “Request/Response parameter formats”.
<b>Returns</b>	Returns a <code>workflowInfoList</code> object containing containing the successfully created workflows.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/workflows?op=c reate&amp;workflowInfoList= &lt;workflowInfoList&gt; &lt;workflowInfo&gt; &lt;name&gt;Publsihing Workflow&lt;/name&gt; &lt;statusInfoList&gt; &lt;statusInfo&gt; &lt;name&gt;New Status 001&lt;/name&gt; &lt;colorBlue&gt;255&lt;/colorBlue&gt; &lt;position&gt;1&lt;/position&gt; &lt;redlineTracking&gt;false&lt;/redlineTracking&gt; &lt;checkInLayoutEvaluation&gt;false&lt;/checkInLayoutEvaluation&gt; &lt;outputLayoutEvaluation&gt;false&lt;/outputLayoutEvaluation&gt; &lt;privilegeInfoList&gt; &lt;privilegeInfo&gt; &lt;roleName&gt;Administrator&lt;/roleName&gt; &lt;roleId&gt;1&lt;/roleId&gt; &lt;overridden&gt;false&lt;/overridden&gt; &lt;contentTypePrivList/&gt; &lt;/privilegeInfo&gt; &lt;/privilegeInfoList&gt; &lt;attributeConstraintsInfoList&gt; &lt;attributeConstraintsInfo&gt; &lt;attributeName&gt;Name&lt;/attributeName&gt; &lt;roleName&gt;Administrator&lt;/roleName&gt; &lt;constraintName&gt;PREVENT CHANGE&lt;/constraintName&gt; &lt;/attributeConstraintsInfo&gt; &lt;/attributeConstraintsInfoList&gt; &lt;/statusInfo&gt; &lt;/statusInfoList&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo&gt; &lt;name&gt;Asset&lt;/name&gt; &lt;/contentTypeInfo&gt; &lt;contentTypeInfo id="1102"/&gt; &lt;/contentTypeInfoList&gt; &lt;/workflowInfo&gt; &lt;/workflowInfoList&gt;</pre>		

	<p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;workflowInfoList&gt; &lt;workflowInfo id="20"&gt; &lt;name&gt;Publishing Workflow&lt;/name&gt; &lt;domainId&gt;18&lt;/domainId&gt; &lt;created&gt;2013-11-28T08:58:00Z&lt;/created&gt; &lt;createdBy&gt;1&lt;/createdBy&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;lastModifiedBy&gt;1&lt;/lastModifiedBy&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;lastModified&gt;2013-11-28T08:58:00Z&lt;/lastModified&gt; &lt;statusInfoList&gt; &lt;statusInfo id="20"&gt; &lt;name&gt;New Status 001&lt;/name&gt; &lt;domainId&gt;6&lt;/domainId&gt; &lt;colorRed&gt;0&lt;/colorRed&gt; &lt;colorGreen&gt;0&lt;/colorGreen&gt; &lt;colorBlue&gt;255&lt;/colorBlue&gt; &lt;position&gt;1&lt;/position&gt; &lt;redlineTracking&gt;false&lt;/redlineTracking&gt; &lt;checkInLayoutEvaluation&gt;false&lt;/checkInLayoutEvaluation&gt; &lt;outputLayoutEvaluation&gt;false&lt;/outputLayoutEvaluation&gt; &lt;privilegeInfoList&gt; &lt;privilegeInfo&gt; &lt;roleName&gt;Administrator&lt;/roleName&gt; &lt;roleId&gt;1&lt;/roleId&gt; &lt;overridden&gt;false&lt;/overridden&gt; &lt;contentTypePrivList/&gt; &lt;/privilegeInfo&gt; &lt;/privilegeInfoList&gt; &lt;attributeConstraintsInfoList&gt; &lt;attributeConstraintsInfo&gt; &lt;attributeId&gt;2&lt;/attributeId&gt; &lt;attributeName&gt;Name&lt;/attributeName&gt; &lt;roleId&gt;1&lt;/roleId&gt; &lt;roleName&gt;Administrator&lt;/roleName&gt; &lt;constraintId&gt;1&lt;/constraintId&gt; &lt;constraintName&gt;PREVENT CHANGE&lt;/constraintName&gt; &lt;/attributeConstraintsInfo&gt; &lt;/attributeConstraintsInfoList&gt; &lt;/statusInfo&gt; &lt;/statusInfoList&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="1102"&gt; &lt;name&gt;Project&lt;/name&gt; &lt;contentTypeHierarchy&gt;System;Asset;Project;&lt;/contentTypeHierarchy&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;childrenAvailable&gt;true&lt;/childrenAvailable&gt; &lt;extensible&gt;true&lt;/extensible&gt; &lt;/contentTypeInfo&gt; &lt;/contentTypeInfoList&gt; &lt;/workflowInfo&gt; &lt;/workflowInfoList&gt;</pre>
--	--

## getWorkflow

<b>Function</b>	Get a workflow with a particular ID or name.	
<b>Description</b>	This request returns all the metadata of a specified workflow.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../admin/workflows/ [workflow name]</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getWorkflow</code>	<code>com.quark.qpp.service.facade Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>workflowInfoList</code> object with the metadata of a specified workflow in XML format.	
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/workflows/workflow1</code></p> <p><b>Result:</b></p> <pre>&lt;workflowInfoList&gt; &lt;workflowInfo id="10"&gt; &lt;name&gt;Workflow1&lt;/name&gt; &lt;domainId&gt;18&lt;/domainId&gt; &lt;created&gt;2013-</pre>	

```

</contentTypeInfoList> </workflowInfo> </workflowInfoList>
```

<b>Function</b>	Get a workflow		
<b>Description</b>	This request returns the metadata and status of a specified workflow.		
<b>Type</b>	Get		
<b>URL Format</b>	<code>.... /admin/workflows/{workflowIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getWorkflow</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>workflowIdOrName</code>	<code>string</code>	The ID or Name of the workflow to be retrieved.
<b>Returns</b>	Returns a <code>workflowInfoList</code> object containing information on the specified workflow.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/workflows/21</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;workflowInfoList&gt; &lt;workflowInfo id="21"&gt; &lt;name&gt;New Workflow&lt;/name&gt; &lt;domainId&gt;18&lt;/domainId&gt; &lt;created&gt;2013-12- 09T11:45:42Z&lt;/created&gt; &lt;createdBy&gt;1&lt;/createdBy&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;lastModifiedBy&gt;1&lt;/lastModifiedBy&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;lastModified&gt;2013- 12-09T11:45:42Z&lt;/lastModified&gt; &lt;statusInfoList&gt; &lt;statusInfo id="24"&gt; &lt;name&gt;New Status 001&lt;/name&gt; &lt;domainId&gt;6&lt;/domainId&gt; &lt;colorRed&gt;0&lt;/colorRed&gt; &lt;colorGreen&gt;0&lt;/colorGreen&gt; &lt;colorBlue&gt;255&lt;/colorBlue&gt; &lt;position&gt;1&lt;/position&gt; &lt;redlineTracking&gt;false&lt;/redlineTracking&gt;</pre>		

## REST FRAMEWORK SERVICES

--	---

### getAllWorkflows

<b>Function</b>	Get all workflows.	
<b>Description</b>	This request returns all the metadata of all the workflows that exist on the QPP Server.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../admin/workflows</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllWorkflows</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>workflowInfoList</code> object containing an array of all the workflows that exist on the QPP Server.	
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/workflows</code></p> <p><b>Result:</b></p> <pre> &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;workflowInfoList&gt; &lt;workflowInfo id="10"&gt; &lt;name&gt;Workflow1&lt;/name&gt; .... &lt;statusInfoList&gt; &lt;statusInfo id="10"&gt; &lt;name&gt;Status1&lt;/name&gt; .... &lt;/statusInfo&gt; &lt;statusInfo id="11"&gt; &lt;name&gt;Status2&lt;/name&gt; .... &lt;/statusInfo&gt; &lt;/statusInfoList&gt; &lt;/workflowInfo&gt; &lt;workflowInfo id="11"&gt; &lt;name&gt;Workflow2&lt;/name&gt; .... &lt;statusInfoList&gt; &lt;statusInfo id="12"&gt; &lt;name&gt;Status1&lt;/name&gt; .... &lt;/statusInfo&gt; &lt;statusInfo id="13"&gt; &lt;name&gt;Status2&lt;/name&gt; .... &lt;/statusInfo&gt; &lt;/statusInfoList&gt; &lt;/workflowInfo&gt; &lt;/workflowInfoList&gt; </pre>	

### updateWorkflows

<b>Function</b>	Update workflows.
-----------------	-------------------

<b>Description</b>	This request is used to update the metadata of a specified single or multiple workflows and their statuses.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.... /admin /workflows</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateWorkflows</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>workflowInfoList=&lt;xml /&gt;</code>		Object containing a list of the successfully updated workflows .
<b>Returns</b>	Returns a <code>workflowInfoList</code> object containing a list of all the successfully updated workflows.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/workflows?op=u pdate&amp;workflowInfoList= &lt;workflowInfoList&gt; &lt;workflowInfo id="22"&gt; &lt;name&gt;DefaultWorkflow New&lt;/name&gt; &lt;/workflowInfo&gt; &lt;/workflowInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;workflowInfoList&gt; &lt;workflowInfo id="22"&gt; &lt;name&gt;DefaultWorkflow New&lt;/name&gt; &lt;domainId&gt;18&lt;/domainId&gt; &lt;created&gt;2013-11-28T09:01:38Z&lt;/created&gt; &lt;createdBy&gt;1&lt;/createdBy&gt; &lt;creatorName&gt;Admin&lt;/creatorName&gt; &lt;lastModifiedBy&gt;1&lt;/lastModifiedBy&gt; &lt;lastModifierName&gt;Admin&lt;/lastModifierName&gt; &lt;lastModified&gt;2013- 11-28T09:03:26Z&lt;/lastModified&gt; &lt;statusInfoList/&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="1100"&gt; &lt;name&gt;Asset&lt;/name&gt; &lt;contentTypeHierarchy&gt;System;Asset;&lt;/contentTypeHierarchy&gt; &lt;domainId&gt;0&lt;/domainId&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;childrenAvailable&gt;true&lt;/childrenAvailable&gt; &lt;extensible&gt;true&lt;/extensible&gt; &lt;/contentTypeInfo&gt; ..... &lt;/contentTypeInfoList&gt; &lt;/workflowInfo&gt; &lt;/workflowInfoList&gt;</pre>		

## deleteWorkflow

<b>Function</b>	Delete a workflow.		
<b>Description</b>	This request is used to delete the specified workflow.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.... /admin /workflows / {workflowIdorName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>deleteWorkflow</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	string	The op parameter allows you to specify

## REST FRAMEWORK SERVICES

			which operation is to be performed. (Mandatory)
	workflowIdOrName	string	ID or Name of the workflow to be deleted.
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p>URL:</p> <pre>http://serverName:serverPort/rest/service/admin/workflows/22?op=delete</pre>		

### createPreferences

Function	Create Preferences.		
Description	This request is used to create a single or multiple preferences at one time.		
Type	POST		
URL Format	<code>.../admin/preferences</code>		
Java API	Method Name		Class Name
	<code>createPreferences</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>preferenceInfoList</code>	string	List of preferences to create.
Returns	Returns a <code>preferenceInfoList</code> object containing a list of successfully created preferences.		
Examples	<p>URL:</p> <pre>http://serverName:serverPort/rest/service/admin/preferences?op=create&amp;preferenceInfoList=&lt;xml/&gt;</pre> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;preferenceInfoList&gt; &lt;preferenceInfo id="10005"&gt; &lt;name&gt;Demo user preference 3&lt;/name&gt; &lt;category id="1"&gt;USER&lt;/category&gt; &lt;possibleValuesExist&gt;false&lt;/possibleValuesExist&gt; &lt;defaultValue&gt;This is the default value.&lt;/defaultValue&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;/preferenceInfo&gt; &lt;preferenceInfo id="10006"&gt; &lt;name&gt;Demo preference without possible values&lt;/name&gt; &lt;category id="0"&gt;SYSTEM&lt;/category&gt; &lt;possibleValuesExist&gt;false&lt;/possibleValuesExist&gt; &lt;defaultValue&gt;This is the default new value.&lt;/defaultValue&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;/preferenceInfo&gt; &lt;/preferenceInfoList&gt;</pre>		

### getPreference

Function	Get a specific preference.
Description	This request returns the metadata of a specified preference.

Type	GET		
URL Format	<code>../admin/preferences/{preferenceIdOrName}</code>		
Java API	Method Name		Class Name
	<code>getPreference</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>preferenceIdOrName</code>	string	The ID or Name of the preference to be retrieved.
Returns	Returns a <code>preferenceInfoList</code> object containing the metadata of the specified preference.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/preferences/Content Display View</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;preferenceInfoList&gt; &lt;preferenceInfo id="2006"&gt; &lt;name&gt;Content Display View&lt;/name&gt; &lt;category id="1"&gt;USER&lt;/category&gt; &lt;possibleValuesExist&gt;true&lt;/possibleValuesExist&gt; &lt;defaultValue id="1"&gt;Keep Last Setting&lt;/defaultValue&gt; &lt;preferenceValueList&gt; &lt;preferenceValue valueId="1" preferenceName="Content Display View" preferenceId="2006"&gt;Keep Last Setting&lt;/preferenceValue&gt; &lt;preferenceValue valueId="2" preferenceName="Content Display View" preferenceId="2006"&gt;WYSIWYG&lt;/preferenceValue&gt; &lt;preferenceValue valueId="3" preferenceName="Content Display View" preferenceId="2006"&gt;Galley&lt;/preferenceValue&gt; &lt;preferenceValue valueId="4" preferenceName="Content Display View" preferenceId="2006"&gt;Full Screen&lt;/preferenceValue&gt; &lt;/preferenceValueList&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;/preferenceInfo&gt; &lt;/preferenceInfoList&gt;</pre>		

## getAllPreferences

Function	Get all Preferences.		
Description	This request returns all of the existing preference definitions.		
Type	GET		
URL Format	<code>../admin/preferences</code>		
Java API	Method Name		Class Name
	<code>getAllPreferences</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	This request requires no input parameters.		
Returns	Returns a <code>preferenceInfoList</code> object containing metadata of all existing preferences with its possible values.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/preferences</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;</pre>		

	<pre>&lt;preferenceInfoList&gt; &lt;preferenceInfo id="1007"&gt; &lt;name&gt;Display all Redline Deletions in One Color&lt;/name&gt; &lt;category id="0"&gt;SYSTEM&lt;/category&gt; &lt;possibleValuesExist&gt;false&lt;/possibleValuesExist&gt; &lt;defaultValue&gt;No&lt;/defaultValue&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;/preferenceInfo&gt; &lt;preferenceInfo id="1008"&gt; &lt;name&gt;Redline Deletion Color&lt;/name&gt; &lt;category id="0"&gt;SYSTEM&lt;/category&gt; &lt;possibleValuesExist&gt;false&lt;/possibleValuesExist&gt; &lt;defaultValue&gt;255,0,0&lt;/defaultValue&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;/preferenceInfo&gt; .... &lt;/preferenceInfoList&gt;</pre>
--	---

### getPreferenceValues

<b>Function</b>	Get Preference values.		
<b>Description</b>	This request is used to get preference values for a given preference corresponding to the logged-in user.		
<b>Type</b>	GET		
<b>URL Format</b>	.....admin/preferencevalues		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	getPreferenceValues		com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	preferences	string	Comma separated list of Ids or Names of Preferences to be retrieved.
<b>Returns</b>	Returns an <code>preferenceValueList</code> object containing the values set for given preferences for the logged-in user.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/preferencevalues?preferences=3018, 1007, 3011, Archive Revisions</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;preferenceValueList&gt; &lt;preferenceValue preferenceName="Display all Redline Deletions in One Color" preferenceId="1007"&gt;No&lt;/preferenceValue&gt; &lt;preferenceValue valueId="1" preferenceName="Default Action for Double Click on Quark XPress Projects" preferenceId="3011"&gt;Do Check Out&lt;/preferenceValue&gt; &lt;preferenceValue valueId="3" preferenceName="Delete Attached Files" preferenceId="3018"&gt;Ask Before Deleting&lt;/preferenceValue&gt; &lt;preferenceValue valueId="3" preferenceName="Archive Revisions" preferenceId="4018"&gt;Ask&lt;/preferenceValue&gt; &lt;/preferenceValueList&gt;</pre>		

**updatePreferences**

<b>Function</b>	Update Preferences.		
<b>Description</b>	This request is used to update the metadata of a specified single or multiple preferences.		
<b>Type</b>	POST		
<b>URL Format</b>	.... /admin/preferences		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	updatePreferences		com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	op=update	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	preferenceinfolist=<x ml/>		Object containing the metadata of the preferences to be updated.
<b>Returns</b>	Returns a preferenceInfoList object containing a list of all the successfully updated preferences.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/preferences?op=update&amp;preferenceinfolist=&lt;xml/&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;preferenceInfoList&gt; &lt;preferenceInfo id="10005"&gt; &lt;name&gt;Demo user preference 3&lt;/name&gt; &lt;category id="1"&gt;USER&lt;/category&gt; &lt;possibleValuesExist&gt;false&lt;/possibleValuesExist&gt; &lt;defaultValue&gt;Ths is the default value.&lt;/defaultValue&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;/preferenceInfo&gt; &lt;preferenceInfo id="10006"&gt; &lt;name&gt;Demo preference without possible values&lt;/name&gt; &lt;category id="0"&gt;SYSTEM&lt;/category&gt; &lt;possibleValuesExist&gt;false&lt;/possibleValuesExist&gt; &lt;defaultValue&gt;This is the default new value.&lt;/defaultValue&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;/preferenceInfo&gt; &lt;/preferenceInfoList&gt;</pre>		

**updatePreferenceValues**

<b>Function</b>	Update Preference Values.		
<b>Description</b>	This request updates the preference values corresponding to the logged-in user.		
<b>Type</b>	POST		
<b>URL Format</b>	... /preferenceValues		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	updatePreferenceValues		com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	op=update	long	The op parameter allows you to specify

## REST FRAMEWORK SERVICES

			which operation is to be performed. (Mandatory)
	preferencevaluelist=[ xml]	string	Object containing the metadata of the preference values to be updated.
Returns	Returns a <code>preferencevaluelist</code> object containing the preferences values successfully updated.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/preferencevalues?op=update&amp;preferencevaluelist=&lt;xml/&gt;</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;preferenceValueList&gt; &lt;preferenceValue valueId="1" preferenceName="user 1" preferenceId="10061"&gt;system value 2&lt;/preferenceValue&gt; &lt;preferenceValue valueId="2" preferenceName="user 2" preferenceId="10062"&gt;system value 3&lt;/preferenceValue&gt; &lt;/preferenceValueList&gt;</pre>		

### deletePreference

Function	Delete a preference.		
Description	This request is used to delete the specified preference.		
Type	POST		
URL Format	<code>.../admin/preferences/{preferenceIdOrName}</code>		
Java API	Method Name		Class Name
	<code>deletePreference</code>		<code>com.quark.qpp.service.facade</code> Class AdminFacade
Parameters	Name	Type	Description
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/preference/{preferenceIdOrName}?op=delete</code></p>		

### createRepositories

Function	Create one or more storage repositories.		
Description	This request is used to create new storage repositories.		
Type	POST		
URL Format	<code>.../admin/repositories</code>		
Java API	Method Name		Class Name
	<code>createRepositories</code>		<code>com.quark.qpp.service.facade</code>

	Class AdminFacade		
Parameters	Name	Type	Description
	op=create	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	Returns a <code>storageRepositoryInfoList</code> object containing a list of successfully created repositories.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/repositories?o p=create&amp;storagerepositoryinfoList= &lt;storageRepositoryInfoList&gt; &lt;storageRepositoryInfo&gt; &lt;name&gt;QPP_Repo1234a73d&lt;/name&gt; &lt;connectionInfo&gt;&lt;connectionProperties&gt;&lt;property name='url' required='false'&gt; \\dinesh- 2k8\Repo1&lt;/property&gt;&lt;/connectionProperties&gt;&lt;/connectionInfo&gt; &lt;repositoryTypeId&gt;1&lt;/repositoryTypeId&gt; &lt;statusId&gt;0&lt;/statusId&gt; &lt;/storageRepositoryInfo&gt; &lt;/storageRepositoryInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;storageRepositoryInfoList&gt; &lt;storageRepositoryInfo id="20"&gt; &lt;name&gt;QPP_Repo1234a73d&lt;/name&gt; &lt;connectionInfo&gt;&lt;connectionProperties&gt;&lt;property name='url' required='false'&gt; \\dinesh- 2k8\Repo1&lt;/property&gt;&lt;/connectionProperties&gt;&lt;/connectionInfo&gt; &lt;repositoryType&gt;fileRepositoryAdapter&lt;/repositoryType&gt; &lt;repositoryTypeId&gt;1&lt;/repositoryTypeId&gt; &lt;status&gt;READ_WRITE&lt;/status&gt; &lt;statusId&gt;1&lt;/statusId&gt; &lt;/storageRepositoryInfo&gt; &lt;/storageRepositoryInfoList&gt;</pre>		

## getRepository

Function	Get a specific repository.		
Description	This request returns a storage repository with the given Id or Name.		
Type	GET		
URL Format	<code>../admin/repositories/{repositoryIdOrName}</code>		
Java API	Method Name		Class Name
	<code>getRepository</code>		<code>com.quark.qpp.service.facade</code> Class AdminFacade
Parameters	Name	Type	Description
	<code>repositoryIdOrName</code>	string	The ID or Name of the repository to be retrieved.
Returns	Returns a <code>repositoryInfoList</code> object containing the metadata of the specified repository.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/repositories/1</pre> <p><b>Result:</b></p>		

```

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<storageRepositoryInfoList> <storageRepositoryInfo id="1">
<name>TestRep1</name>
<connectionInfo><connectionProperties><property name='url'
required='true'>
C:\TestRep1</property></connectionProperties></connectionInfo>
<repositoryType>fileRepositoryAdapter</repositoryType>
<repositoryTypeId>1</repositoryTypeId>
<status>READ_WRITE</status> <statusId>1</statusId>
</storageRepositoryInfo> <storageRepositoryInfo id="10">
<name>TestRepA</name>
<connectionInfo><connectionProperties><property name='url'
required='true'>
C:\TestRepA</property></connectionProperties></connectionInfo>
<repositoryType>fileRepositoryAdapter</repositoryType>
<repositoryTypeId>1</repositoryTypeId>
<status>READ_WRITE</status> <statusId>1</statusId>
</storageRepositoryInfo> </storageRepositoryInfoList>

```

### getAllRepositories

<b>Function</b>	Get all storage repositories.	
<b>Description</b>	This request returns all the information regarding all repositories registered with the platform.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>../admin/repositories</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllRepositories</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>storageRepositoryInfoList</code> object containing a list of all the registered repositories.	
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/repositories</code></p> <p><b>Result:</b></p> <pre> &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;storageRepositoryInfoList&gt; &lt;storageRepositoryInfo id="1"&gt; &lt;name&gt;TestRep1&lt;/name&gt; &lt;connectionInfo&gt;&lt;connectionProperties&gt;&lt;property name='url' required='true'&gt; C:\TestRep1&lt;/property&gt;&lt;/connectionProperties&gt;&lt;/connectionInfo&gt; &lt;repositoryType&gt;fileRepositoryAdapter&lt;/repositoryType&gt; &lt;repositoryTypeId&gt;1&lt;/repositoryTypeId&gt; &lt;status&gt;READ_WRITE&lt;/status&gt; &lt;statusId&gt;1&lt;/statusId&gt; &lt;/storageRepositoryInfo&gt; &lt;storageRepositoryInfo id="10"&gt; &lt;name&gt;TestRepA&lt;/name&gt; &lt;connectionInfo&gt;&lt;connectionProperties&gt;&lt;property name='url' required='true'&gt; C:\TestRepA&lt;/property&gt;&lt;/connectionProperties&gt;&lt;/connectionInfo&gt; &lt;repositoryType&gt;fileRepositoryAdapter&lt;/repositoryType&gt; &lt;repositoryTypeId&gt;1&lt;/repositoryTypeId&gt; &lt;status&gt;READ_WRITE&lt;/status&gt; &lt;statusId&gt;1&lt;/statusId&gt; &lt;/storageRepositoryInfo&gt; &lt;/storageRepositoryInfoList&gt; </pre>	

**updateRepositories**

<b>Function</b>	Update one or more storage repositories.		
<b>Description</b>	This request is used to update the storage repositories on the system.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.... /admin/repositories</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updateRepositories</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>storagerepositoryinfo</code> <code>list=&lt;xml/&gt;</code>		Object containing the metadata of the storage repositories to be updated.
<b>Returns</b>	Returns a <code>storageRepositoryInfoList</code> object containing a list of all the successfully updated storage repositories.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/repositories?o p=update&amp;storagerepositoryinfolist= &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;storageRepositoryInfoList&gt; &lt;storageRepositoryInfo id="24"&gt; &lt;name&gt;QPP_Repo11&lt;/name&gt; &lt;connectionInfo&gt;&lt;connectionProperties&gt;&lt;property name='url' required='false'&gt; \\dinesh- 2k8\Repo1&lt;/property&gt;&lt;/connectionProperties&gt;&lt;/connectionInfo&gt; &lt;repositoryType&gt;fileRepositoryAdapter&lt;/repositoryType&gt; &lt;repositoryTypeId&gt;1&lt;/repositoryTypeId&gt; &lt;status&gt;READ_WRITE&lt;/status&gt; &lt;statusId&gt;1&lt;/statusId&gt; &lt;/storageRepositoryInfo&gt; &lt;/storageRepositoryInfoList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;storageRepositoryInfoList&gt; &lt;storageRepositoryInfo id="24"&gt; &lt;name&gt;QPP_Repo11&lt;/name&gt; &lt;connectionInfo&gt;&lt;connectionProperties&gt;&lt;property name='url' required='false'&gt; \\dinesh- 2k8\Repo1&lt;/property&gt;&lt;/connectionProperties&gt;&lt;/connectionInfo&gt; &lt;repositoryType&gt;fileRepositoryAdapter&lt;/repositoryType&gt; &lt;repositoryTypeId&gt;1&lt;/repositoryTypeId&gt; &lt;status&gt;READ_WRITE&lt;/status&gt; &lt;statusId&gt;1&lt;/statusId&gt; &lt;/storageRepositoryInfo&gt; &lt;/storageRepositoryInfoList&gt;</pre>		

**deleteRepository**

<b>Function</b>	Delete a storage repository.	
<b>Description</b>	This request is used to delete the specified storage repository.	
<b>Type</b>	POST	
<b>URL Format</b>	<code>.... /admin/repositories/{repositoryIdorName}</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>deleteRepository</code>	<code>com.quark.qpp.service.facade</code>

## REST FRAMEWORK SERVICES

	Name	Type	Description
Parameters	op=delete	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<b>URL:</b> <a href="http://serverName:serverPort/rest/service/admin/repositories/10?op=delete">http://serverName:serverPort/rest/service/admin/repositories/10?op=delete</a>		

### createPrivileges

<b>Function</b>	Create Privileges.		
<b>Description</b>	This request creates the required privilege definition(s).		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../privileges?op=create</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createPrivileges</code>		<code>com.quark.qpp.service.facadeClass.AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>privilegedefinitionlist =&lt;XML/&gt;</code>	string	A privilegeDefinitionList object in XML format. See “Request/Response parameter formats.”
<b>Returns</b>	Returns a <code>privilegeDefinitionList</code> object containing the metadata of the newly created privileges.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/admin/privileges?op=create</code>  <b>Result:</b> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;privilegeDefinitionList&gt; &lt;privilegeDefinition name="Sample Privilege" id="2500000"&gt; &lt;group id="100000"&gt;General&lt;/group&gt; &lt;statusBased&gt;true&lt;/statusBased&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;contentPrivilege&gt;true&lt;/contentPrivilege&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="1100"&gt; &lt;name&gt;Asset&lt;/name&gt; &lt;/contentTypeInfo&gt; &lt;/contentTypeInfoList&gt; &lt;/privilegeDefinition&gt; &lt;/privilegeDefinitionList&gt;</pre>		

### getPrivilege

<b>Function</b>	Get Privilege.		
<b>Description</b>	This request returns a specific privilege(s) in system with given id or name.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../privileges/{privilegeIdOrName}</code>		

<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	getPrivilege	com.quark.qpp.service.facadeClass AdminFacade
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns specific privilege(s) in system with given ID or name. If privilege name is specified and there exists multiple privileges in different privilege groups, with the given name, list of all such privileges will be returned.	
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/privileges/Override Another Users Checkout</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;privilegeDefinitionList&gt; &lt;privilegeDefinition name="Override Another Users Checkout" id="1000003"&gt; &lt;group id="100000"&gt;General&lt;/group&gt; &lt;statusBased&gt;true&lt;/statusBased&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;contentPrivilege&gt;true&lt;/contentPrivilege&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="1100"&gt;...&lt;/contentTypeInfo&gt; &lt;contentTypeInfo id="1101"&gt;...&lt;/contentTypeInfo&gt; &lt;contentTypeInfo id="1102"&gt; &lt;name&gt;Project&lt;/name&gt; &lt;/contentTypeInfo&gt; &lt;contentTypeInfo id="1103"&gt; &lt;name&gt;Picture&lt;/name&gt; &lt;/contentTypeInfo&gt; &lt;contentTypeInfo id="1104"&gt;...&lt;/contentTypeInfo&gt; &lt;contentTypeInfo id="1105"&gt;...&lt;/contentTypeInfo&gt; &lt;/contentTypeInfoList&gt; &lt;/privilegeDefinition&gt; ..... .... &lt;/privilegeDefinitionList&gt;</pre>	

### getAllPrivileges

<b>Function</b>	Get All Privileges.		
<b>Description</b>	This request returns all privilege definitions in the system.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../privileges</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	getAllPrivileges	com.quark.qpp.service.facadeClass AdminFacade	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>contenttype=[true false]</code>	boolean	Defaul value is true
	<code>application=[true false]</code>	boolean	Defaul value is true
<b>Returns</b>	Returns a <code>privilegeDefinitionList</code> object containing the metadata of all privileges in the system.		
<b>Examples</b>	<b>URL:</b>		
	<code>http://serverName:serverPort/rest/service/admin/privileges</code>		
	<b>Result:</b>		

```

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<privilegeDefinitionList> <privilegeDefinition name="Check In New" id="1000001"> <group id="100000">General</group>
<statusBased>false</statusBased>
<systemDefined>true</systemDefined>
<contentPrivilege>true</contentPrivilege>
<contentTypeInfoList> <contentTypeInfo id="1100">
<name>Asset</name> </contentTypeInfo> <contentTypeInfo id="1101"> <name>Document</name> </contentTypeInfo>
<contentTypeInfo id="1102">...</contentTypeInfo>
<contentTypeInfo id="1103">...</contentTypeInfo>
<contentTypeInfo id="1104">...</contentTypeInfo> ...
</contentTypeInfoList> </privilegeDefinition> ..... ....
</privilegeDefinitionList>

```

### getApplicableApplicationPriveleges

<b>Function</b>	Get applicable application privileges for the logged in user.		
<b>Description</b>	This request returns enabled applicable application privileges for the logged in user. Applicable privileges are a union of all the privileges granted to him as a user as well as to groups of which the user is a member.		
<b>Type</b>	GET		
<b>URL Format</b>	.. /admin/users/		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	getApplicableApplicationPrivil eges		com.quark.qpp.service.facade Class AdminFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	op= applicableapplication privileges	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	privileges= [comma-separated list of privilege Names or IDs]	string	The set of privilege values. (Optional)
	Returns the <code>applicationPrivList</code> object containing all of the applicable applicaton privileges.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/users?</code>  <code>op=applicableapplicationprivileges</code></p> <p><b>Result:</b></p> <pre> &lt;applicationPrivList&gt; &lt;privilege id="140000023"&gt; &lt;name&gt;Delete&lt;/name&gt; &lt;privilegeHierarchy&gt; Administration;Storage;Storage Rules;Delete &lt;/privilegeHierarchy&gt; &lt;/privilege&gt; &lt;privilege id="140000022"&gt; &lt;name&gt;Create/Modify&lt;/name&gt; &lt;privilegeHierarchy&gt; Administration;Storage;Storage Rules;Create/Modify &lt;/privilegeHierarchy&gt; &lt;/privilege&gt; ..... &lt;/applicationPrivList&gt; Get enabled applicable application privileges for the logged in user from the given privileges:URL:<code>http://serverName:serverPort/rest/service/admin</code> <code>/users?</code> </pre>		

	<pre>op=applicableapplicationprivileges&amp;privileges=140000023,...,Re sult: &lt;applicationPrivList&gt; &lt;privilege id="140000023"&gt; &lt;name&gt;Delete&lt;/name&gt; &lt;privilegeHierarchy&gt; Administration;Storage;Storage Rules;Delete &lt;/privilegeHierarchy&gt; &lt;/privilege&gt; &lt;privilege id="140000022"&gt; &lt;name&gt;Create/Modify&lt;/name&gt; &lt;privilegeHierarchy&gt; Administration;Storage;Storage Rules;Create/Modify &lt;/privilegeHierarchy&gt; &lt;/privilege&gt; ..... &lt;/applicationPrivList&gt;</pre>
--	--

### getApplicableContentPrivileges

<b>Function</b>	Get applicable content privileges for the logged in user.		
<b>Description</b>	This request returns enabled privileges of the given content type applicable for the logged in user. Applicable privileges are a union of all the privileges granted to him as a user as well as to groups of which the user is a member.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>../admin/users/</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>getApplicableContentPrivileges</code>	<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=</code> <code>applicablecontentprivileges</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>contenttype=[contentTy</code> <code>pe ID or Name or</code> <code>Hierarch]</code>	string	
<b>Returns</b>	<code>privileges= [comma-</code> <code>separated list of</code> <code>privilege Names or</code> <code>IDs]</code>	string	The set of privilege values. (Optional)
	Returns the <code>contentPrivList</code> object containing all of the applicable content privileges.		
	<b>URL:</b> <code>http://serverName:serverPort/rest/service/admin/users?</code> <code>op=applicablecontentprivileges&amp;contenttype=Picture</code>  <b>Result:</b> <code>&lt;contentTypePriv&gt; &lt;privilege id="3000006"&gt; &lt;name&gt;Change Workflow of Checked In Asset&lt;/name&gt; &lt;privilegeHierarchy&gt; Edit Attributes;Change Workflow of Checked In Asset</code> <code>&lt;/privilegeHierarchy&gt; &lt;/privilege&gt; &lt;privilege id="10000015"&gt;</code> <code>&lt;name&gt;Get Original Assets&lt;/name&gt;</code> <code>&lt;privilegeHierarchy&gt;General;Get Original Assets&lt;/privilegeHierarchy&gt;</code> </privilege> </contentTypePriv> Get enabled applicable content privileges for the logged in user from the given <code>privileges:URL:<code>http://serverName:serverPort/rest/service/admin/users?</code></code> <code>op=applicablecontentprivileges&amp;contenttype=Picture&amp;privileges=</code>		
<b>Examples</b>			

## REST FRAMEWORK SERVICES

	<pre>3000006, 10000015Result: &lt;contentTypePriv&gt; &lt;privilege id="3000006"&gt; &lt;name&gt;Change Workflow of Checked In Asset&lt;/name&gt; &lt;privilegeHierarchy&gt; Edit Attributes;Change Workflow of Checked In Asset &lt;/privilegeHierarchy&gt; &lt;/privilege&gt; &lt;privilege id="10000015"&gt; &lt;name&gt;Get Original Assets&lt;/name&gt; &lt;privilegeHierarchy&gt;General;Get Original Assets&lt;/privilegeHierarchy&gt; &lt;/privilege&gt; &lt;/contentTypePriv&gt;</pre>
--	---

### updatePrivileges

<b>Function</b>	Update Privileges.		
<b>Description</b>	This request updates the required privilege definition(s).		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../privileges?op=update</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updatePrivileges</code>		<code>com.quark.qpp.service.facadeClass</code> <code>AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>privilegedefinitionli</code> <code>st =&lt;XML/&gt;</code>	string	A privilegeDefinitionList object in XML format. See “Request/Response parameter formats.”
<b>Returns</b>	Returns a <code>privilegeDefinitionList</code> object containing the metadata of the successfully updated privileges.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/privileges?op=upd</code> <code>ate</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;privilegeDefinitionList&gt; &lt;privilegeDefinition name="Sample Privilege" id="2500000"&gt; &lt;group id="100000"&gt;General&lt;/group&gt; &lt;statusBased&gt;true&lt;/statusBased&gt; &lt;systemDefined&gt;false&lt;/systemDefined&gt; &lt;contentPrivilege&gt;true&lt;/contentPrivilege&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="1100"&gt; &lt;name&gt;Asset&lt;/name&gt; &lt;/contentTypeInfo&gt; &lt;contentTypeInfo id="1102"&gt; &lt;name&gt;Project&lt;/name&gt; &lt;/contentTypeInfo&gt; &lt;/contentTypeInfoList&gt; &lt;/privilegeDefinition&gt; &lt;/privilegeDefinitionList&gt;</pre>		

### deletePrivilege

<b>Function</b>	Delete Privilege.		
<b>Description</b>	This request deletes the specified privilege Id.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../privileges/{privilegeIdOrName}?op=delete</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>deletePrivilege</code>		<code>com.quark.qpp.service.facadeClass</code>

		AdminFacade
Parameters	This request requires no input parameters.	
Returns	A status of 200 is returned in response to a successful request execution.	
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/privileges/{privilegeIdOrName} ?op=delete</pre>	

### createPrivilegeGroups

Function	Creates New Privilege Group.		
Description	This request creates new privilege group along with its subgroups and privileges in the specified hierarchy.		
Type	POST		
URL Format	<code>.../privilegegroups?op=create</code>		
Java API	Method Name		Class Name
	<code>createPrivilegeGroups</code>		<code>com.quark.qpp.service.facadeClass</code> <code>AdminFacade</code>
Parameters	Name	Type	Description
	<code>privilegegroupdefinitionlist =&lt;XML/&gt;</code>	string	A <code>privilegeGroupDefinitionList</code> object in XML format. See "Request/Response parameter formats."
Returns	Returns a <code>privilegeGroupDefinitionList</code> object containing the metadata of the successfuy created privilege groups.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/admin/privilegegroups?op=create</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;privilegeGroupDefinitionList&gt; &lt;privilegeGroupDefinition name="Sample Privilege Group"&gt; &lt;privilegeDefinitionList&gt; &lt;privilegeDefinition name="Check In New" id="1000001"&gt; &lt;group id="100000"&gt;General&lt;/group&gt; &lt;statusBased&gt;false&lt;/statusBased&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;contentPrivilege&gt;true&lt;/contentPrivilege&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="1100"&gt; &lt;name&gt;Asset&lt;/name&gt; &lt;/contentTypeInfo&gt; &lt;contentTypeInfo id="1100"&gt; &lt;name&gt;CustomContent-Type_49933&lt;/name&gt; &lt;/contentTypeInfo&gt; &lt;/contentTypeInfoList&gt; &lt;/privilegeDefinition&gt; &lt;/privilegeDefinitionList&gt; &lt;parentGroup id="-1"/&gt; &lt;/privilegeGroupDefinition&gt; &lt;/privilegeGroupDefinitionList&gt;</pre>		

### getPrivilegeGroup

Function	Get Privilege Group Definition.
Description	This request returns all existing privilege group definitions.

## REST FRAMEWORK SERVICES

Type	GET	
URL Format	<code>.../privilegegrroups/{privilegeGroupIdOrName}</code>	
Java API	Method Name	Class Name
	<code>getPrivilegeGroup</code>	<code>com.quark.qpp.service.facade Class AdminFacade</code>
Parameters	This request requires no input parameters.	
Returns	Returns information for the specified privilege group based on its id or name specified.	
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/privilegegrroups/General</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;privilegeGroupDefinitionList&gt; &lt;privilegeGroupDefinition name="General" id="100000"&gt; &lt;privilegeDefinitionList&gt; &lt;privilegeDefinition name="Check In New" id="1000001"&gt; &lt;group id="100000"&gt;General&lt;/group&gt; &lt;statusBased&gt;false&lt;/statusBased&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;contentPrivilege&gt;true&lt;/contentPrivilege&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="1100"&gt; &lt;name&gt;Asset&lt;/name&gt; &lt;/contentTypeInfo&gt; ... &lt;/contentTypeInfoList&gt; &lt;/privilegeDefinition&gt; ..... .... &lt;/privilegeDefinitionList&gt;</pre>	

### getAllPrivilegeGroups

Function	Get All Privilege Group Definitions.	
Description	This request returns all existing privilege group definitions.	
Type	GET	
URL Format	<code>.../privilegegrroups</code>	
Java API	Method Name	Class Name
	<code>getAllPrivilegeGroups</code>	<code>com.quark.qpp.service.facade Class AdminFacade</code>
Parameters	This request requires no input parameters.	
Returns	Returns all existing privilege group definitions. Each privilege group contains its information along with its privileges and sub-privilege group definitions.	
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/privilegegrups</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;privilegeGroupDefinition name="Administration" id="99998"&gt; .. &lt;/privilegeGroupDefinition&gt; &lt;privilegeGroupDefinition name="Workspace" id="99999"&gt; ... &lt;/privilegeGroupDefinition&gt; &lt;privilegeGroupDefinition name="General" id="100000"&gt; &lt;privilegeDefinitionList&gt; &lt;privilegeDefinition name="Check In New" id="1000001"&gt; &lt;group id="100000"&gt;General&lt;/group&gt; &lt;statusBased&gt;false&lt;/statusBased&gt;</pre>	

	<pre>&lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;contentPrivilege&gt;true&lt;/contentPrivilege&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="1100"&gt; &lt;name&gt;Asset&lt;/name&gt; &lt;/contentTypeInfo&gt; ... &lt;/contentTypeInfoList&gt; &lt;/privilegeDefinition&gt; ..... .... &lt;/privilegeDefinitionList&gt;</pre>
--	--

### updatePrivilegeGroups

<b>Function</b>	Updates Given Privilege Group.		
<b>Description</b>	This request updates the given privilege group.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../privilegegroups?op=update</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>updatePrivilegeGroups</code>		<code>com.quark.qpp.service.facadeClass.AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>privilegegroupdefinitionlist =&lt;XML/&gt;</code>	string	A <code>privilegeGroupDefinitionList</code> object in XML format. See "Request/Response parameter formats."
<b>Returns</b>	Returns a <code>privilegeGroupDefinitionList</code> object containing the metadata of the successfuly updated privilege groups.		
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/admin/privilegegroups?op=update</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;privilegeGroupDefinitionList&gt; &lt;privilegeGroupDefinition name="Sample Privilege Group"&gt; &lt;privilegeDefinitionList&gt; &lt;privilegeDefinition name="Check In New" id="1000001"&gt; &lt;group id="100000"&gt;General&lt;/group&gt; &lt;statusBased&gt;false&lt;/statusBased&gt; &lt;systemDefined&gt;true&lt;/systemDefined&gt; &lt;contentPrivilege&gt;true&lt;/contentPrivilege&gt; &lt;contentTypeInfoList&gt; &lt;contentTypeInfo id="1100"&gt; &lt;name&gt;Asset&lt;/name&gt; &lt;/contentTypeInfo&gt; &lt;contentTypeInfo id="1100"&gt; &lt;name&gt;CustomContent-Type_49933&lt;/name&gt; &lt;/contentTypeInfo&gt; &lt;/contentTypeInfoList&gt; &lt;/privilegeDefinition&gt; &lt;/privilegeDefinitionList&gt; &lt;parentGroup id="-1"/&gt; &lt;/privilegeGroupDefinition&gt; &lt;/privilegeGroupDefinitionList&gt;</pre>		

### deletePrivilegeGroup

<b>Function</b>	Deletes Given Privilege Group.	
<b>Description</b>	This request deletes the given privilege group.	
<b>Type</b>	POST	
<b>URL Format</b>	<code>.../privilegegroups/{privilegeGroupIdOrName} ?op=delete</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>

## REST FRAMEWORK SERVICES

	<code>deletePrivilegeGroup</code>	<code>com.quark.qpp.service.facadeClass AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.	
	<b>URL:</b>	
<b>Examples</b>	<code>http://serverName:serverPortt/rest/service/admin/privilegegrroups/{privilegeGroupIdOrName} ?op=delete</code>	

### addDomainValue

<b>Function</b>	Add a domain value.		
<b>Description</b>	This request is used to add a new value in domain under the mentioned parent value. If the parent value Id is -1, then the domain value will be added at root level.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../domains/{domainIdOrName} /{newValueName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>addDomainValue</code>		<code>com.quark.qpp.service.facade Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>Parentvalue</code>	string	Id/Name of the domain value under which new domain value is to be added.
	<code>sourceref</code>	string	Source reference of the new domain value.
	<code>position</code>	string	Position among siblings where the domain value will be added. Can have values like 1, 5,...,(use -1 to add domain value at the end).
<b>Returns</b>	Returns metadata of the newly created domain value.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPortt/rest/service/admin/domains/501/SampleQPPDomainVal_a2b</code>		
	<b>Result:</b> <code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;domainValue id="1"&gt; &lt;name&gt;SampleQPPDomainVal_a2b&lt;/name&gt; &lt;valueHierarchy&gt;Desktop&lt;/valueHierarchy&gt; &lt;sourceReference&gt;source&lt;/sourceReference&gt; &lt;/domainValue&gt;</code>		

### getDomainValue

<b>Function</b>	Get Domain Value.
<b>Description</b>	This request returns desired DomainValue information.

Type	GET	
URL Format	<code>.../domains/{domainIdOrName}/{valueId}</code>	
Java API	Method Name	Class Name
	<code>getDomainValue</code>	<code>com.quark.qpp.service.facade Class AdminFacade</code>
Parameters	This request requires no input parameters.	
Returns	Returns metadata of the specified domain value.	
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/domains/Users/10</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;domainValue id="10"&gt; &lt;name&gt;Admin2&lt;/name&gt; &lt;valueHierarchy&gt;Desktop&lt;/valueHierarchy&gt; &lt;/domainValue&gt;</pre>	

### getDomainValueXml

Function	Get XML Value for Given Domain.		
Description	This request returns xml value of the given domain value.		
Type	GET		
URL Format	<code>.../domains/{domainIdOrName}/{valueId}</code>		
Java API	Method Name		Class Name
	<code>getDomainValueXml</code>		<code>com.quark.qpp.service.facadeClass SessionFacade</code>
Parameters	Name	Type	Description
	<code>op=fetchxml</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	Returns xml value of the given domain value.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/domains/{domainIdOrName}/{valueId}?op=fetchxml</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;sampleXMLvalue/&gt;</pre>		

### setDomainValueXml

Function	Set XML Value for Given Domain.		
Description	This request sets xml for the given domain value.		
Type	POST		
URL Format	<code>.../domains/{domainIdOrName}/{valueId}</code>		

## REST FRAMEWORK SERVICES

<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	setDomainValueXml		com.quark.qpp.service.facadeClass SessionFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	op=setxmlvalue	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	valueId=[]	string	Id of the domain value whose xml is to be set.
	xmlvalue=[XML Dat]	string	XML Content.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/domains/{domainIdOrName}/{valueId}?op=setxmlvalue&amp;valueid={Id of Domain Value}&amp;xmlvalue={XML Data}</code>		

### searchDomainValues

<b>Function</b>	Search Domain with XML Values with matching Xpath Expression.		
<b>Description</b>	This request finds domain values whose xml matches with the given xpath.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../domains/{domainIdOrName}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	searchDomainValues		com.quark.qpp.service.facadeClass SessionFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	op=searchvalues	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	xpath=[]	string	Expression to be used for finding required domain values.
<b>Returns</b>	Returns a <code>domainValueList</code> object whose xml matches with the given XPath.		
<b>Examples</b>	<b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/domains/{domainIdOrName} ?op=searchvalues&amp;xpath={xpath to match the XML Value for Defined Domain}</code>		

### updateDomainValue

<b>Function</b>	Update a domain value.
<b>Description</b>	This request is used to updates the name and source reference of the domain value

	with the given ID.		
Type	POST		
URL Format	<code>.../domains/{domainIdOrName}/{ValueId}</code>		
Java API	<b>Method Name</b>		<b>Class Name</b>
	<code>updateDomainValue</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=update</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>name</code>	string	The new name for the domain value.
	<code>sourceref</code>	string	The source reference of the domain value to be updated.
Returns	Returns metadata of the successfully updated domain value.		
Examples	<p><b>URL:</b></p> <pre><code>http://serverName:serverPort/rest/service/admin/domains/501/1?op=update &amp;name=NewName&amp;sourceref=updatedSourceRef</code></pre> <p><b>Result:</b></p> <pre><code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;domainValue id="1"&gt; &lt;name&gt;newName&lt;/name&gt; &lt;valueHierarchy&gt;Desktop&lt;/valueHierarchy&gt; &lt;sourceReference&gt;updatedSourceRef&lt;/sourceReference&gt; &lt;/domainValue&gt;</code></pre>		

## deleteDomainValue

Function	Delete a domain value.		
Description	This request is used to delete the value of a domain.		
Type	POST		
URL Format	<code>.../domains/{domainIdOrName}/{ValueId}</code>		
Java API	<b>Method Name</b>		<b>Class Name</b>
	<code>deleteDomainValue</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p><b>URL:</b></p> <pre><code>http://serverName:serverPort/rest/service/admin/domains/501/1?op=delete</code></pre>		

**getFavorites**

<b>Function</b>	Get all Favorites.	
<b>Description</b>	This request returns all of the favorites items of the logged-on user.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../admin/favorites</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getFavorites</code>	<code>com.quark.qpp.service.facade Class AdminFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>favoriteItemList</code> object containing metadata of all of the favorites items for the logged-in user.	
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/favorites</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;favoriteItemlist&gt; &lt;favoriteItem position="1" type="QUERY" id="100"&gt;Default&lt;/favoriteItem&gt; &lt;favoriteItem position="2" type="COLLECTION" id="10"&gt;Home/Pictures&lt;/favoriteItem&gt; &lt;/favoriteItemlist&gt;</pre>	

**setFavorites**

<b>Function</b>	Set Favorites.	
<b>Description</b>	This request sets the favorites items for the logged-in user.	
<b>Type</b>	POST	
<b>URL Format</b>	<code>.../favorites</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>setFavorites</code>	<code>com.quark.qpp.service.facade Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>
	<code>op=setfavorites</code>	long
	<code>favoriteitemlist=[xml]</code>	string
<b>Returns</b>	Returns a <code>favoriteItemList</code> object containing the metadata of favorite items successfully set for logged-in user.	
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/admin/preferencevalues?</code>  <code>op=update&amp;preferencevaluelist=&lt;xml/&gt;</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;</pre>	

	<pre>&lt;favoriteItemlist&gt; &lt;favoriteItem position="1" type="QUERY"&gt;     id="100"&gt;Default&lt;/favoriteItem&gt; &lt;favoriteItem position="2"     type="COLLECTION" id="10"&gt;Home/Pictures&lt;/favoriteItem&gt; &lt;/favoriteItemlist&gt;</pre>
--	---

### getWorkflowInitiatingStatuses

Function	Get Workflow initial statuses.		
Description	This request returns a list of “Workflow Initiating Statuses” for the given workflow. If the roleIdOrName parameter is specified then “Workflow Initiating Statuses” will be returned on the basis of overridden status transitions for the given userclass, otherwise the default initiating statuses are returned.		
Type	GET		
URL Format	<code>.../workflows/{workflowIdOrName}</code>		
Java API	Method Name		Class Name
	<code>getWorkflowInitiatingStatuses</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>workflowinitiatingstatusesModule=true</code>	boolean	
Parameters	<code>role={ roleIdOrName }</code>	string	The ID or Name of the role whose Workflow Initiating Statuses you wish to be retrieved.
Returns	Returns a <code>statusInfoList</code> object containing its metadata.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/workflows/Workflow1?workflowinitiatingstatuses=true&amp;role=10</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;statusInfoList&gt; &lt;statusInfo id="10"&gt; &lt;name&gt;Status1&lt;/name&gt; &lt;domainId&gt;6&lt;/ domainId&gt; &lt;colorRed&gt;50&lt;/colorRed&gt; &lt;colorGreen&gt;150&lt;/colorGreen&gt; &lt;colorBlue&gt;10&lt;/colorBlue&gt; &lt;position&gt;1&lt;/position&gt; &lt;redlineTracking&gt;false&lt;/ redlineTracking&gt; &lt;checkInLayoutEvaluation&gt;false&lt;/checkInLayoutEvaluation&gt; &lt;outputLayoutEvaluation&gt;false&lt;/outputLayoutEvaluation&gt; &lt;privilegeInfoList&gt; &lt;privilegeInfo&gt; &lt;roleName&gt;Administrator&lt;/roleName&gt; &lt;roleId&gt;1&lt;/roleId&gt; &lt;overridden&gt;false&lt;/overridden&gt; &lt;contentTypePrivList/&gt; &lt;/privilegeInfo&gt; ... &lt;/privilegeInfoList&gt; &lt;/statusInfo&gt; &lt;/statusInfoList&gt;</pre>		

### getStatusTransitions

Function	Get Status Transitions.
Description	This request returns the status transitions set for the given workflow. If the statusIdOrName parameter is specified, then status transitions for a particular status are returned. If the roleIdOrName parameter is specified, then the overridden

## REST FRAMEWORK SERVICES

	transitions for the given role for particular workflow will be returned. Otherwise the default status transitions are returned.		
Type	GET		
URL Format	<code>.../workflows/{workflowIdOrName}</code>		
Java API	Method Name		Class Name
	<code>getStatusTransistions</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
Parameters	Name	Type	Description
	<code>statustransitions=true</code>	boolean	
	<code>status={statusIdOrName}</code>	string	The ID or Name of the status whose Status Transitions you wish to be retrieved."
Returns	<code>role={ roleIdOrName}</code>	string	The ID or Name of the role whose Status Transitions you wish to be retrieved ."
	Returns an <code>statusTransitionInfoList</code> object containing a list of StatusTransitions set for the given workflow or workflow status for specified role.		
	<b>URL:</b> <code>http://serverName:serverPort/rest/service/workflows/Workflow1?statustransitions=true&amp;role=20</code>  <b>Result:</b> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;statusTransitionInfoList&gt; &lt;statusTransitionInfo id="10"&gt; &lt;name&gt;Status1&lt;/name&gt; &lt;workflowInitiatingStatus&gt;true&lt;/workflowInitiatingStatus&gt; &lt;nextPossibleStatusInfoList&gt; &lt;nextPossibleStatusInfo id="11"&gt; &lt;name&gt;Status2&lt;/name&gt; &lt;/nextPossibleStatusInfo&gt; &lt;/nextPossibleStatusInfoList&gt; &lt;/statusTransitionInfo&gt; &lt;statusTransitionInfo id="11"&gt; &lt;name&gt;Status2&lt;/name&gt; &lt;workflowInitiatingStatus&gt;false&lt;/workflowInitiatingStatus&gt; &lt;/statusTransitionInfo&gt; &lt;/statusTransitionInfoList&gt;</pre>		
Examples			

## Publishing

The publishing capabilities of the API allow application developers to publish content and includes the following REST calls:

- `getPublishingChannels`
- `getAllPublishingChannels`
- `getDeliveryChannels`
- `publishAsset`
- `publishBasedOnURI`
- `publishBasedOnStreamContext`
- `createDatadoc`
- `getDatadocChannels`

- *fetchDatadocAssets*
- *executeDatadocChannel*
- *updateDatadoc*
- *detachDatadocChannel*

### getPublishingChannels

<b>Function</b>	Get the publishing channels for a particular content type.	
<b>Description</b>	This request returns the metadata of all the available publishing channels for given content type. Null will be returned in case the channel doesn't exist for the given content type.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../publish/publishingchannels/[content type name or ID]</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getPublishingChannels</code>	<code>com.quark.qpp.service.facade Class PublishFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>publishingChannelList</code> object.	
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/publish/publishingchannels/Picture</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;publishingChannelList&gt; &lt;publishingChannelInfo name="IM.JPG" id="convertImage"&gt; &lt;parameter&gt;SOURCE_FILE_EXTENSION&lt;/parameter&gt; &lt;parameter&gt;OUTPUT_FILE_NAME&lt;/parameter&gt; &lt;/publishingChannelInfo&gt; &lt;publishingChannelInfo name="Extract Image Metadata" id="extractImageAttributes"&gt; &lt;parameter&gt;SOURCE_FILE_EXTENSION&lt;/parameter&gt; &lt;parameter&gt;OUTPUT_FILE_NAME&lt;/parameter&gt; &lt;/publishingChannelInfo&gt; &lt;publishingChannelInfo name="EPS.JPG" id="epsPreview"&gt; &lt;parameter&gt;SOURCE_FILE_EXTENSION&lt;/parameter&gt; &lt;parameter&gt;OUTPUT_FILE_NAME&lt;/parameter&gt; &lt;/publishingChannelInfo&gt; &lt;/publishingChannelList&gt;</pre>	

### getAllPublishingChannels

<b>Function</b>	Get all publishing channels.	
<b>Description</b>	This request returns the metadata of all existing Publishing Channels with their parameters.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../publish/publishingchannels</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllPublishingChannels</code>	<code>com.quark.qpp.service.facade Class PublishFacade</code>

## REST FRAMEWORK SERVICES

<b>Parameters</b>	This request requires no input parameters.
<b>Returns</b>	Returns a <code>publishingChannelList</code> object containing an array of all existing publishing channels.
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/publish/publishingchannels</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;publishingChannelList&gt; &lt;publishingChannelInfo name="PDF" id="qxpPdf"&gt; &lt;parameter&gt;ASSET_ID&lt;/parameter&gt; .... &lt;/publishingChannelInfo&gt; &lt;publishingChannelInfo name="JPEG.ZIP" id="qxpImage"&gt; &lt;parameter&gt;ASSET_ID&lt;/parameter&gt; .... &lt;/publishingChannelInfo&gt; .... &lt;/publishingChannelList&gt;</pre>

### getDeliveryChannels

<b>Function</b>	Get all delivery channels.	
<b>Description</b>	This request returns the metadata of all existing Delivery Channels with their parameters.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../publish/deliverychannels</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getDeliveryChannels</code>	<code>com.quark.qpp.service.facade</code> Class PublishFacade
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>publishingChannelList</code> object containing an array of all existing delivery channels.	
<b>Examples</b>	<b>URL:</b>	
		<pre>http://serverName:serverPort/rest/service/publish/deliverychannels</pre>
<b>Examples</b>	<b>Result:</b>	
		<pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;publishingChannelList&gt; &lt;publishingChannelInfo name="Publish to Sharepoint" id="checkInToSharepoint"&gt; &lt;parameter&gt;ASSET_ID&lt;/parameter&gt; .... &lt;/publishingChannelInfo&gt; &lt;publishingChannelInfo name="Publish to FileNet" id="checkInToFileNet"&gt; &lt;parameter&gt;ASSET_ID&lt;/parameter&gt; .... &lt;/publishingChannelInfo&gt; .... &lt;/publishingChannelList&gt;</pre>

### publishAsset

<b>Function</b>	Publish an asset.
<b>Description</b>	This request returns the stream after publishing an asset into a specified format using the publishing channel.
<b>Type</b>	GET

<b>URL Format</b>	<code>.../publish/[asset ID] or /publish//publishbypath/[asset path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>publishAsset</code>		<code>com.quark.qpp.service.facade</code> <code>Class PublishFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>publishingchannel</code> =[Publishing Channel] & [Publishing Channel Parameters]	string	The publishing channel used for publishing the content along with publishing parameters (specific to provided publishing channel)(Mandatory)
<b>Returns</b>	Returns the filestream after publishing an asset into required format.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/publish/[asset ID]?</code>  <code>publishingchannel=qxpPdf&amp;parameter1=value1?...</code></p> <p><b>Result:</b>  The filestream after publishing an asset into required format.</p>		

<b>Function</b>	Deliver an asset.		
<b>Description</b>	This request delivers a QPP or Non-QPP asset at any fileserver, sharepoint server, filenet or documentum.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../publish/[asset ID] or /publish//publishbypath/[asset path]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>publishAsset</code>		<code>com.quark.qpp.service.facade</code> <code>Class PublishFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>deliverychannel</code> =[Delivery Channel] & [Delivery Channel Parameters]	string	The delivery channel used to deliver a QPP asset or published content to any of the available delivery channels. (Mandatory)Delivery channel parameters are specific to the channel and all are mandatory.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://serverName:serverPort/publish/[asset ID]?</code>  <code>deliverychannel=checkInToFileNet&amp;parameter1=value1?...</code></p>		

<b>Function</b>	Publish and deliver an asset.		
<b>Description</b>	This request publishes any QPP or Non-QPP asset into the required format and delivers the published content at any fileserver, sharepoint server, filenet or documentum at the same time.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../publish/[asset ID]/publish/[asset ID] or</code>		

## REST FRAMEWORK SERVICES

	/publish//publishbypath/[asset path]		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	publishAsset		com.quark.qpp.service.facade Class PublishFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	publishingchannel =[Publishing Channel] & [Publishing Channel Parameters]	string	The publishing channel used for publishing the content along with publishing parameters (specific to provided publishing channel).
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/publish/[asset ID]? publishingchannel=qxpPdf&amp; deliverychannel=checkInToFileNet&amp; parameter1=value1?...</pre>		

### publishBasedOnURI

<b>Function</b>	Publish a non-Platform resource.		
<b>Description</b>	Takes input in the form of URI.		
<b>Type</b>	GET		
<b>URL Format</b>	.../publish		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	publishBasedOnURI		com.quark.qpp.service.facade Class PublishFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	uri	string	Input a non QPP resource available on any of the URIs. Supported URIs are file, qpp, classpath, SharePoint and http.
	publishingchannel	string	The publishing channel used for publishing the content along with publishing parameters (specific to provided publishing channel).
<b>Returns</b>	Returns the filestream of output after publishing an asset to the required format.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/publish?uri=file: \\server1\\abc\\abc.xml40&amp; publishingchannel=busDocPdf</pre> <p><b>Result:</b></p> <p>The filestream of output after publishing an asset to the required format.</p>		

<b>Function</b>	Deliver a non-Platform resource.		
<b>Description</b>	Include the file in the request body or as file part. Takes input in the form of URI.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../publish</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>publishBasedOnURI</code>		<code>com.quark.qpp.service.facade</code> <code>Class PublishFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>uri</code>	string	Input the non QPP resource available on any of the URIs. Supported URIs are file, qpp, classpath, SharePoint and http.
	<code>deliverychannel</code>	string	The delivery channel used to deliver the QPP asset or published content to any of the available delivery channels. Delivery channel parameters are specific to the channel and all are mandatory.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<p><b>URL:</b></p> <code>http://serverName:serverPort/rest/service/publish?uri=qpp://assets/40&amp;deliverychannel=FileSystem&amp;LOCATION=C:\DATA\temp</code>		

### **publishBasedOnStreamContext**

<b>Function</b>	Publish a non-platform resource.		
<b>Description</b>	This request will publish a non-platform resource. Takes input in the form of a file stream.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../publish</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>publishBasedOnStreamContext</code>		<code>com.quark.qpp.service.facade</code> <code>Class PublishFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>publishingchannel</code>	string	The publishing channel used for publishing the content along with publishing parameters (specific to provided publishing channel).
<b>Returns</b>	Returns the filestream of output after publishing an asset to the required format.		
<b>Examples</b>	<p><b>URL:</b></p> <code>http://serverName:serverPort/rest/service/publish?publishingchannel=busDocPdf</code> <p><b>Result:</b></p> <p>The filestream of output after publishing an asset to the required format.</p>		

## REST FRAMEWORK SERVICES

<b>Function</b>	Deliver a non-Platform resource.		
<b>Description</b>	Publish and deliver non-platform resource. Takes input in the form of a file stream.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../publish</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>publishBasedOnStreamContext</code>		<code>com.quark.qpp.service.facade</code> <code>Class PublishFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>deliverychannel</code>	string	The delivery channel used to deliver the QPP asset or published content to any of the available delivery channels. Delivery channel parameters are specific to the channel and all are mandatory.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/publish?deliverychannel=FileSystem&amp;LOCATION=C:\DATA\temp</code>		

### createDatadoc

<b>Function</b>	Create a Datadoc.		
<b>Description</b>	This request creates a datadoc by executing the given datadoc channel and checks it in to the platform with the given metadata.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../datadocchannels</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createDatadoc</code>		<code>com.quark.qpp.service.facade</code> <code>Class PublishFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=createdatadoc</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>datadocchannel={DataDoc Channel Id}</code>	string	The Datadoc channel. (Mandatory)
	<code>createMinorVersion={true false}</code>	boolean	Indicates whether you should create a Minor version.
	<code>attributevalues=&lt;XML/&gt;</code>	string	See “Request/Response parameter formats.”
<b>Returns</b>	Returns the metadata of newly created Datadoc asset.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/publish/?op=createdatadoc &amp;datadocchannel=createDataDocAssetFromHttpUrl &amp;CONTENT_URL=http://Server:Port/SampleBusDoc.xml &amp;attributevalues=&lt;?xml version="1.0" encoding="UTF-8"?&gt;</code>		

	<pre>&lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;SampleBusDoc827574.xml &lt;/attributeValue&gt; &lt;attributeValue valueId="1" type="popup" name="Routed to" id="25"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue valueId="10" type="popup" name="Status" id="24"&gt;Status1&lt;/attributeValue&gt; &lt;attributeValue valueId="1" type="popup" name="Collection" id="55"&gt;Home&lt;/attributeValue&gt; &lt;attributeValue valueId="10" type="popup" name="Workflow" id="54"&gt;Workflow1&lt;/attributeValue&gt; &lt;attributeValue valueId="1104" type="popup" name="Content Type" id="62"&gt;Business Document&lt;/attributeValue&gt; &lt;attributeValue valueId="0" type="text" name="File extension" id="11"&gt;xml&lt;/attributeValue&gt; &lt;attributeValue valueId="0" type="text" name="Original filename" id="33"&gt;SampleBusDoc827.xml&lt;/attributeValue&gt; &lt;/attributeValueList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="61"&gt; &lt;assetVersion minorVersion="0" majorVersion="1"/&gt; &lt;attributeValueList&gt; &lt;attributeValue type="numeric" name="Id" id="1"&gt;61&lt;/attributeValue&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;SampleBusDoc827574.xml&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Created" id="3"&gt;2014-10- 28T11:39:46Z&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Last modified" id="4"&gt;2014-10- 28T11:39:46Z&lt;/attributeValue&gt; &lt;attributeValue multiValued="false" valueId="1" type="popup" name="Creator" id="5"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue multiValued="false" valueId="1" type="popup" name="Last modifier" id="6"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue type="numeric" name="Major version" id="7"&gt;1&lt;/attributeValue&gt; &lt;attributeValue type="text" name="File path" id="8"&gt;/00/3d/61.1-0.1.1.xml&lt;/attributeValue&gt; &lt;attributeValue type="text" name="File extension" id="11"&gt;xml&lt;/attributeValue&gt; &lt;attributeValue type="numeric" name="File size" id="12"&gt;1591&lt;/attributeValue&gt; &lt;attributeValue type="boolean" name="Is checked out" id="13"&gt;false&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Last content update" id="19"&gt;2014-10-28T11:39:46Z&lt;/attributeValue&gt; .... &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre>
--	---

## getDatadocChannels

<b>Function</b>	Get all datadoc channels.	
<b>Description</b>	This request returns all channels of type 'datadoc' that exist in the system.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../datadocchannels</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getDatadocChannels</code>	<code>com.quark.qpp.service.facade Class PublishFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>publishingChannelList</code> object containing the metadata of channels of type datadoc.	
<b>Examples</b>	<b>URL:</b>	

## REST FRAMEWORK SERVICES

	<p><code>http://serverName:serverPort/rest/service/publish/datadocchannels</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;publishingChannelList&gt; &lt;publishingChannelInfo name="Create Data Document From HTTP URL" id="createDataDocAssetFromHttpUrl"&gt; &lt;parameter&gt;CONTENT_URL&lt;/parameter&gt; &lt;parameter&gt;XSL_URI&lt;/parameter&gt; &lt;/publishingChannelInfo&gt; &lt;publishingChannelInfo name="Fetch Excel Data Object" id="fetchExcelDataObject"&gt; &lt;parameter&gt;ASSET_ID&lt;/parameter&gt; &lt;parameter&gt;WORKSHEET_NAME&lt;/parameter&gt; &lt;parameter&gt;DATA_OBJECT_TYPE&lt;/parameter&gt; &lt;parameter&gt;DATA_OBJECT_NAME&lt;/parameter&gt; &lt;parameter&gt;OUTPUT_FORMAT&lt;/parameter&gt; &lt;parameter&gt;OUTPUT_FORMAT_PROPERTIES&lt;/parameter&gt; &lt;/publishingChannelInfo&gt; &lt;/publishingChannelList&gt;</pre>
--	--

<b>Function</b>	Get DataDoc Channels for Desired Content-Type.	
<b>Description</b>	This request returns channels of type DataDoc which are mapped to the given content type.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../datadocchannels/{contentType IdOrName}</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getDatadocChannels</code>	<code>com.quark.qpp.service.facade</code> <code>Class PublishFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>publishingChannelList</code> object containing the metadata of channels of type 'datadoc' mapped to a specific content type.	
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/publish/datadocchannels/{Contenty-Type Id }</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;publishingChannelList&gt; &lt;publishingChannelInfo name="Fetch Excel Data Object" id="fetchExcelDataObject"&gt; &lt;parameter&gt;ASSET_ID&lt;/parameter&gt; &lt;parameter&gt;WORKSHEET_NAME&lt;/parameter&gt; &lt;parameter&gt;DATA_OBJECT_TYPE&lt;/parameter&gt; &lt;parameter&gt;DATA_OBJECT_NAME&lt;/parameter&gt; &lt;parameter&gt;OUTPUT_FORMAT&lt;/parameter&gt; &lt;parameter&gt;OUTPUT_FORMAT_PROPERTIES&lt;/parameter&gt; &lt;/publishingChannelInfo&gt; &lt;/publishingChannelList&gt;</pre>	

### fetchDatadocAssets

<b>Function</b>	Fetch Datadoc Assets.
<b>Description</b>	This request returns the metadata of the datadoc assets which had been created by executing the given channel and parameters.
<b>Type</b>	GET

<b>URL Format</b>	<code>...publish/</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>fetchDatadocAssets</code>		<code>com.quark.qpp.service.facadeClass</code> <code>PublishFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=fetchdatadocassets</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
<b>Returns</b>	Returns the metadata of the Datadoc asset created through the supplied datadoc channel.		
<b>Examples</b>	<p><b>URL:</b></p> <pre><code>http://serverName:serverPort/rest/service/publish? op=fetchdatadocassets&amp;datadocchannel=createDataDocAssetFromHttpUr l</code></pre> <p><b>Result:</b></p> <pre><code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="61"&gt; &lt;assetVersion minorVersion="0" majorVersion="1"/&gt; &lt;attributeValueList&gt; &lt;attributeValue type="numeric" name="Id" id="1"&gt;61&lt;/attributeValue&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;SampleBusDoc827574.xml&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Created" id="3"&gt;2014-10- 28T11:39:46Z&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Last modified" id="4"&gt;2014-10- 28T11:39:46Z&lt;/attributeValue&gt; &lt;attributeValue multiValued="false" valueId="1" type="popup" name="Creator" id="5"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue multiValued="false" valueId="1" type="popup" name="Last modifier" id="6"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue type="numeric" name="Major version" id="7"&gt;1&lt;/attributeValue&gt; &lt;attributeValue type="text" name="File path" id="8"/&gt;/00/3d/61.1-0.1.1.xml&lt;/attributeValue&gt; &lt;attributeValue type="text" name="File extension" id="11"&gt;xml&lt;/attributeValue&gt; &lt;attributeValue type="numeric" name="File size" id="12"&gt;1591&lt;/attributeValue&gt; &lt;attributeValue type="boolean" name="Is checked out" id="13"&gt;false&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Last content update" id="19"&gt;2014-10-28T11:39:46Z&lt;/attributeValue&gt; .... &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</code></pre>		

### executeDatadocChannel

<b>Function</b>	Execute Datadoc Channels.	
<b>Description</b>	This request executes the given datadoc channel and writes the resulted datadoc content to the given outputstream.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>...publish/</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>

## REST FRAMEWORK SERVICES

	executeDatadocChannel		com.quark.qpp.service.facadeClass PublishFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	op=executedatadocchannel	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	datadocchannel={DataDoc Channel Id}	string	The Datadoc channel. (Mandatory)
	channelparameters=<XML/>	string	Channel parameters.
<b>Returns</b>	Resultant output is returned in the response body stream.		
<b>Examples</b>	<b>URL:</b> <a href="http://serverName:serverPort/rest/service/publish?op=executedatadocchannel&amp;datadocchannel=fetchExcelDataObject&amp;...">http://serverName:serverPort/rest/service/publish?op=executedatadocchannel&amp;datadocchannel=fetchExcelDataObject&amp;...</a>		

### updateDatadoc

<b>Function</b>	Update a Datadoc.		
<b>Description</b>	This request updates the existing datadoc asset by creating its new version. Latest content of the asset is fetched by executing the desired datadoc channel.		
<b>Type</b>	POST		
<b>URL Format</b>	...publish/{assetId}		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	updateDatadoc		com.quark.qpp.service.facadeClass PublishFacade
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	op=updatedatadoc	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	datadocchannel={DataDoc Channel Id}	string	The Datadoc channel. (Mandatory)
	createMinorVersion={true false}	boolean	Indicates whether you should create a Minor version.
	attributevalues=<XML/>	string	See “Request/Response parameter formats.”
<b>Returns</b>	Returns the metadata of the successfully updated Datadoc asset.		
<b>Examples</b>	<b>URL:</b> <a &gt;admin&lt;="" &gt;samplebusdoc827574.xml="" &gt;status1&lt;="" &lt;="" &lt;attributevalue="" &lt;attributevaluelist&gt;="" 1.0"="" ?&gt;="" attributevalue&gt;="" attributevalue&gt;"="" encoding="UTF-8" href="http://serverName:serverPort/rest/service/publish/?op=createdatadoc &amp;datadocchannel=createDataDocAssetFromHttpUrl &amp;CONTENT_URL=http://Server:Port/SampleBusDoc.xml &amp;attributevalues=&lt;?xml version=" id="24" name="Status" type="popup" valueid="10">http://serverName:serverPort/rest/service/publish/?op=createdatadoc &amp;datadocchannel=createDataDocAssetFromHttpUrl &amp;CONTENT_URL=http://Server:Port/SampleBusDoc.xml &amp;attributevalues=&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;attributeValueList&gt; &lt;attributeValue valueId="0" type="text" name="Name" id="2"&gt;SampleBusDoc827574.xml &lt;/attributeValue&gt; &lt;attributeValue valueId="1" type="popup" name="Routed to" id="25"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue valueId="10" type="popup" name="Status" id="24"&gt;Status1&lt;/attributeValue&gt;</a>		

	<pre>&lt;attributeValue valueId="1" type="popup" name="Collection" id="55"&gt;Home&lt;/attributeValue&gt; &lt;attributeValue valueId="10" type="popup" name="Workflow" id="54"&gt;Workflow1&lt;/attributeValue&gt; &lt;attributeValue valueId="1104" type="popup" name="Content Type" id="62"&gt;Business Document&lt;/attributeValue&gt; &lt;attributeValue valueId="0" type="text" name="File extension" id="11"&gt;xml&lt;/attributeValue&gt; &lt;attributeValue valueId="0" type="text" name="Original filename" id="33"&gt;SampleBusDoc827.xml&lt;/attributeValue&gt; &lt;/attributeValueList&gt;</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="61"&gt; &lt;assetVersion minorVersion="0" majorVersion="1"/&gt; &lt;attributeValueList&gt; &lt;attributeValue type="numeric" name="Id" id="1"&gt;61&lt;/attributeValue&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;SampleBusDoc827574.xml&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Created" id="3"&gt;2014-10- 28T11:39:46Z&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Last modified" id="4"&gt;2014-10- 28T11:39:46Z&lt;/attributeValue&gt; &lt;attributeValue multiValued="false" valueId="1" type="popup" name="Creator" id="5"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue multiValued="false" valueId="1" type="popup" name="Last modifier" id="6"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue type="numeric" name="Major version" id="7"&gt;1&lt;/attributeValue&gt; &lt;attributeValue type="text" name="File path" id="8"&gt;/00/3d/61.1-0.1.1.xml&lt;/attributeValue&gt; &lt;attributeValue type="text" name="File extension" id="11"&gt;xml&lt;/attributeValue&gt; &lt;attributeValue type="numeric" name="File size" id="12"&gt;1591&lt;/attributeValue&gt; &lt;attributeValue type="boolean" name="Is checked out" id="13"&gt;false&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Last content update" id="19"&gt;2014-10-28T11:39:46Z&lt;/attributeValue&gt; .... &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre>
--	--

### detachDatadocChannel

<b>Function</b>	Detach a DataDoc asset from its source.		
<b>Description</b>	This request detaches or unlinks the given datadoc asset from its source content and creates a new version of the asset. After detaching/unlinking, the given asset will no more be a datadoc asset and thus can be checked-out and checked-in by the end user like other conventional assets in the Platform.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../publish/{assetId}/</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>detachDatadocChannel</code>	<code>com.quark.qpp.service.facadeClass</code> <code>PublishFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=detachdatadoc</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributevalues=&lt;XML/</code>	string	The Datadoc channel. (Mandatory)

## REST FRAMEWORK SERVICES

	>		
	<code>createMinorVersion={t rue false}</code>	boolean	Indicates whether you should create a Minor version.
Returns	Returns the metadata of newly created asset.		
	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/publish? op=detachdatadoc&amp;attributevalues=&lt;xml/&gt;&amp;createminorversion=false</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="61"&gt; &lt;assetVersion minorVersion="0" majorVersion="1"/&gt; &lt;attributeValueList&gt; &lt;attributeValue type="numeric" name="Id" id="1"&gt;61&lt;/attributeValue&gt; &lt;attributeValue type="text" name="Name" id="2"&gt;SampleBusDoc827574.xml&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Created" id="3"&gt;2014-10- 28T11:39:46Z&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Last modified" id="4"&gt;2014-10- 28T11:39:46Z&lt;/attributeValue&gt; &lt;attributeValue multiValued="false" valueId="1" type="popup" name="Creator" id="5"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue multiValued="false" valueId="1" type="popup" name="Last modifier" id="6"&gt;Admin&lt;/attributeValue&gt; &lt;attributeValue type="numeric" name="Major version" id="7"&gt;1&lt;/attributeValue&gt; &lt;attributeValue type="text" name="File path" id="8"&gt;/00/3d/61.1-0.1.1.xml&lt;/attributeValue&gt; &lt;attributeValue type="text" name="File extension" id="11"&gt;xml&lt;/attributeValue&gt; &lt;attributeValue type="numeric" name="File size" id="12"&gt;1591&lt;/attributeValue&gt; &lt;attributeValue type="boolean" name="Is checked out" id="13"&gt;false&lt;/attributeValue&gt; &lt;attributeValue type="dateTime" name="Last content update" id="19"&gt;2014-10-28T11:39:46Z&lt;/attributeValue&gt; .... &lt;/attributeValueList&gt; &lt;/assetInfo&gt;</pre>		
Examples			

### Script execution

The script execution capabilities of the API allow application developers to execute Platform scripts and includes the following REST calls:

- *createScript*
- *getScriptContent*
- *getAllScripts*
- *executeScript*
- *deleteScript*

#### createScript

Function	Create a script.
Description	This request creates a new script with the given content and name at the platform server. In the script execution information it is mandatory to mention the trigger type and corresponding eventInfo or scheduleInfo depending upon the trigger

	type. Include the file in the request body or as file part.		
Type	POST		
URL Format	<code>.../scripts/{scriptName}</code>		
Java API	Method Name		Class Name
	<code>createScript</code>		<code>com.quark.qpp.service.facade</code> <code>Class ScriptFacade</code>
Parameters	Name	Type	Description
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This operation requires parent asset to be in a Checked-Out state.
	<code>language</code>	long	The scripting language
	<code>scriptexecutioninfo =&lt;xml/&gt;</code>	string	The set of attribute values. See "Request/Response parameter formats."
Returns	Returns an <code>scriptInfo</code> object containing metadata of the successfully created script.		
Examples	<p><b>URL:</b>  <code>http://serverName:serverPort/rest/service/scripts?op=create</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;scriptInfo id="12"&gt; &lt;name&gt;abc.js&lt;/name&gt; &lt;language&gt;javascript&lt;/language&gt; &lt;createdDate&gt;2015-01-06T10:32:31Z&lt;/createdDate&gt; &lt;lastModified&gt;2015-01-06T10:32:31Z&lt;/lastModified&gt; &lt;lastExecutionLog&gt;NOT_RUN&lt;/lastExecutionLog&gt; &lt;creator id="1"&gt;Admin&lt;/creator&gt; &lt;lastModifiedBy id="1"&gt;Admin&lt;/lastModifiedBy&gt; &lt;scriptExecutionInfo triggerType="MANUAL"/&gt; &lt;/scriptInfo&gt;</pre>		

## getScriptContent

Function	Get the content of a script.		
Description	This request returns the content of the required script in text format.		
Type	GET		
URL Format	<code>.../scripts/[script ID or name]</code>		
Java API	Method Name		Class Name
	<code>getScriptContent</code>		<code>com.quark.qpp.service.facade</code> <code>Class ScriptFacade</code>
Parameters	This request requires no input parameters.		
Returns	Returns the actual content of the required script in text format.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/scripts/QppFunctions importPackage(Packages.com.quark.qpp.filetransfergateway.service); importPackage(Packages.java.io); importPackage(Packages.com.quark.qpp.core.asset.service.constants);</pre>		

	<pre>importPackage(Packages.com.quark.qpp.core.query.service.dto); importPackage(Packages.com.quark.qpp.core.query.service.constants); importPackage(Packages.com.quark.qpp.core.content.service.constants); importPackage(com.quark.qpp.common.dto); importPackage(com.quark.qpp.common.constants); .....</pre> <p><b>Result:</b></p> <p>The actual content of the required script in text format.</p>
--	---

## getAllScripts

<b>Function</b>	Get all scripts.	
<b>Description</b>	This request returns all scripts stored at the platform server.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../scripts/</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllScripts</code>	<code>com.quark.qpp.service.facade Class ScriptFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>scriptInfoList</code> object that contains the metadata of all scripts. See the table in the “Request/Response parameter formats” chapter.	
<b>Examples</b>	<p><b>URL:</b></p> <p><code>http://serverName:serverPort/rest/service/scripts</code></p> <p><b>Result:</b></p> <pre>&lt;scriptInfoList&gt; &lt;scriptInfo id="11"&gt; &lt;name&gt;GetSavedSearchResults&lt;/name&gt; &lt;language&gt;javascript&lt;/language&gt; &lt;createdDate&gt;2015-01-06T10:23:37Z&lt;/createdDate&gt; &lt;lastModified&gt;2015-01-06T10:23:37Z&lt;/lastModified&gt; &lt;lastExecutionLog&gt;NOT_RUN&lt;/lastExecutionLog&gt; &lt;creator id="1"&gt;Admin&lt;/creator&gt; &lt;lastModifiedBy id="1"&gt;Admin&lt;/lastModifiedBy&gt; &lt;scriptExecutionInfo triggerType="MANUAL"/&gt; &lt;/scriptInfo&gt; ... &lt;/scriptInfoList&gt;</pre>	

## executeScript

<b>Function</b>	Execute a script.		
<b>Description</b>	This request executes a specified script that is already saved on the QPP Server.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>... /scripts/[script ID or name]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>executeScript</code>		<code>com.quark.qpp.service.facade Class ScriptFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=execute</code>	string	The op parameter allows you to specify which operation is to be performed.

		(Mandatory) This operation executes the complete script.
<b>Returns</b>	The response depends upon the output of the script.	
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/scripts/GetSavedSearchResults?op=execute</pre> <p><b>Result:</b></p> <pre>Total No Of Assets : 4 Name: Tulips Collection: Home Workflow: Workflow1 Status: Status1 Routed To: Admin Name: Duplicate_asset Collection: Home Workflow: Workflow1 Status: Status1 Routed To: Admin Name: 1quark2.jpg Collection: Home Workflow: Workflow1 Status: Status1 Routed To: Admin Name: 15116.qxp Collection: Home Workflow: Workflow1 Status: Status1 Routed To: Admin</pre>	

<b>Function</b>	Execute a script method.		
<b>Description</b>	This request executes a specified method of a specified script that is already saved on the QPP Server.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../scripts/[script ID or name]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>executeScript</code>		<code>com.quark.qpp.service.facade</code> <code>Class ScriptFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=execute&amp;</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)This operation executes given the method of the script along with the given parameters.
	<code>methodname=[method name]&amp;</code>	string	Specify the method name to be executed. (Mandatory)
	<code>parameters=x,y,z</code>	long or string	Specify the method's parameters if required. (Optional)
<b>Returns</b>	The response depends upon the output of the script.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/scripts/Sample?op=execute&amp;methodname=abc</pre> <p><b>Result:</b></p> <p>The response depends upon the output of the script.</p>		

### deleteScript

<b>Function</b>	Delete a script.
<b>Description</b>	This request deletes the specified script.

## REST FRAMEWORK SERVICES

Type	POST		
URL Format	<code>.../scripts/{scriptName}</code>		
Java API	Method Name		Class Name
	<code>deleteScript</code>		<code>com.quark.qpp.service.facade</code> <code>Class ScriptFacadeClass</code> <code>AssetFacade</code>
Parameters	Name	Type	Description
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory) This request will lock the asset internally and delete it from system.
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p>URL:  <code>http://serverName:serverPort/rest/service/scripts/12?op=delete</code></p>		

## Archive and Restore management

The archive and restore management capabilities of the API allow application developers to archive assets (metadata and its high\_res) at the collection/query level and provides extensibility to restore/import the same assets into a different QPP server environment. This includes the following REST calls:

- `archiveCollectionAssets`
- `archiveQueryAssets`
- `archiveAssets`
- `restoreAssets`

### archiveCollectionAssets

Function	Archive collection assets.		
Description	This request archives all assets belonging to a particular collection, from the given collection ID or complete collection path.		
Type	GET		
URL Format	<code>.../archive/collectionassets?..</code>		
Java API	Method Name		Class Name
	<code>archiveCollectionAssets</code>		<code>com.quark.qpp.service.facade</code> <code>Class ArchiveFacade</code>
Parameters	Name	Type	Description
	<code>collection</code>	string	Name/ID of the collection. (Mandatory)
	<code>destinationfolder</code>	string	The path. Any file path that is accessible to the server, it could be on a network. (Mandatory)
	<code>allversions=[true  </code>	boolean	Defaults to true. (Optional) If true, the

	<code>false]</code>		server will archive all available versions of all assets.
	<code>archiverelations=[true   false]</code>	boolean	Defaults to true. (Optional) If true, the server will maintain all the relations of assets to be archived.
	<code>deleteafterarchive=[true   false]</code>	boolean	Defaults to false. (Optional) If true, the server will delete all the assets after archiving it.
<b>Returns</b>	Returns an <code>archiveRestoreInfo</code> object in XML format.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/archive/ collectionassets?collection=Home&amp;destinationfolder=C:\QPP Archive</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;archiveRestoreInfo failureCount="0" successCount="50"&gt; &lt;summary&gt; Archive Summary Log Date: 5/01/13 17:17 PM Archive location: C:\QPP Archive Total assets to be archived: 50 Number of assets successfully archived: 50 Number of assets failed to archive: 0 Per Version Listing of Assets ----- Asset Versions Successfully Archived: ----- Home/SampleBusDocdcl.qxp, Version: 1.0 Home/Construct/Construct - Copy.zip, Version: 1.0 Home/Construct/Construct.zip, Version: 1.0 Home/Construct/Construct1/Construct.rar, Version: 1.0 Home/Construct/Construct1/dineshjj.xml, Version: 1.0 &lt;/summary&gt; &lt;/archiveRestoreInfo&gt;</pre>		

### archiveQueryAssets

<b>Function</b>	Archive resulted assets of any given saved search.		
<b>Description</b>	This request archives all assets returned in the query result for the given query name.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../archive/searchresults?..</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>archiveQueryAssets</code>		<code>com.quark.qpp.service.facade</code> <code>Class ArchiveFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>searchname</code>	string	Name of the saved search. (Mandatory)
	<code>destinationfolder</code>	string	The path. Any file path that is accessible to server, it could be on network. (Mandatory)
	<code>allversions=[true   false]</code>	boolean	Defaults to true.(Optional)If true, the server will archive all available versions of all assets.
	<code>archiverelations=[true   false]</code>	boolean	Defaults to true.(Optional)If true, the server will maintain all the relations of

## REST FRAMEWORK SERVICES

			assets to be archived.
	<code>deleteafterarchive=[true   false]</code>	boolean	Defaults to false.(Optional)If true,the server will delete all the assets after archiving it.
<b>Returns</b>	Returns an <code>archiveRestoreInfo</code> object in XML format.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/archive/searchresults?searchname=Default&amp;destinationfolder=C:\QPP Archive</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;archiveRestoreInfo failureCount="0" successCount="50"&gt; &lt;summary&gt; Archive Summary Log Date: 5/01/13 17:17 PM Archive location: C:\QPP Archive Total assets to be archived: 50 Number of assets successfully archived: 50 Number of assets failed to archive: 0 Per Version Listing of Assets ----- Asset Versions Successfully Archived: ----- Home/SampleBusDocdc1.qxp, Version: 1.0 Home/Construct/Construct - Copy.zip, Version: 1.0 Home/Construct/Construct.zip, Version: 1.0 Home/Construct/Construct1/Construct.rar, Version: 1.0 Home/Construct/Construct1/dineshjj.xml, Version: 1.0 &lt;/summary&gt; &lt;/archiveRestoreInfo&gt;</pre>		

### archiveAssets

<b>Function</b>	Archive specified assets.		
<b>Description</b>	This request archives an asset from the given asset id or asset path.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../archive/assets...</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>archiveAssets</code>		<code>com.quark.qpp.service.facade</code> <code>Class ArchiveFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>assets</code>	long or string	The IDs or Collection Path of assets to be archived. (Mandatory) Comma separated IDs of assets (long), or a collection path of assets (string).
	<code>destinationfolder</code>	string	The path. Any file path that is accessible to server, it could be on network. (Mandatory)
	<code>allversions=[true   false]</code>	boolean	Defaults to true.(Optional)If true, the server will archive all available versions of all assets.
	<code>archiverelations=[true   false]</code>	boolean	Defaults to true.(Optional)If true, the server will maintain all the relations of assets to be archived.
	<code>deleteafterarchive=[true   false]</code>	boolean	Defaults to false.(Optional)If true, the

	<code>rue   false]</code>		server will delete all the assets after archiving it.
Returns	Returns an <code>archiveRestoreInfo</code> object in XML format.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/archive/ assets?assets=1102,1229&amp;destinationfolder=C:\QPP Archive</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;archiveRestoreInfo failureCount="0" successCount="50"&gt; &lt;summary&gt; Archive Summary Log Date: 5/01/13 17:17 PM Archive location: C:\QPP Archive Total assets to be archived: 50 Number of assets successfully archived: 50 Number of assets failed to archive: 0 Per Version Listing of Assets ----- Asset Versions Successfully Archived: ----- Home/SampleBusDocdc1.qxp, Version: 1.0 Home/Construct/Construct - Copy.zip, Version: 1.0 Home/Construct/Construct.zip, Version: 1.0 Home/Construct/Construct1/Construct.rar, Version: 1.0 Home/Construct/Construct1/dineshjj.xml, Version: 1.0 &lt;/summary&gt; &lt;/archiveRestoreInfo&gt;</pre>		

### restoreAssets

Function	Restore archived assets into the system.		
Description	This request restores assets from the given folder path. This request requires the same collection hierarchy with same set of workflow, users etc which existed at the time of archiving the assets.		
Type	GET		
URL Format	<code>.../restore?...</code>		
Java API	<b>Method Name</b>	<b>Class Name</b>	
	<code>restoreAssets</code>		<code>com.quark.qpp.service.facade</code> <code>Class RestoreFacade</code>
Parameters	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>archivedpath</code>	string	The full path of the folder which contains the archived assets and its information. (Mandatory)
Parameters	<code>lookup</code>	string	Specify the lookup strategy to be used for fetching entities, like content type, relation type and attributes. Use name to restore across different servers, else use id. (Optional, Default value is id)
Returns	Returns an <code>archiveRestoreInfo</code> object in XML format.		
Examples	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/ restore?archivedpath=C:\QPP Archive</pre> <p><b>Result:</b></p>		

```

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<archiveRestoreInfo failureCount="0" successCount="50">
<summary> Archive Summary Log Date: 5/01/13 17:17 PM Archive

</summary> </archiveRestoreInfo>

```

## Office

The Office capabilities of the API allow application developers to fetch metadata from Excel worksheets, fetch information about Excel Data objects (like named range, dynamic range, tables and chartes) defined in a worksheet and get and transform Excel Data. The Office capabilities includes the following REST calls:

- [\*getExcelChart\*](#)
- [\*getExcelChartBasedOnStream\*](#)
- [\*getExcelChartBasedOnURI\*](#)
- [\*getExcelTable\*](#)
- [\*getExcelTableBasedOnStream\*](#)
- [\*getExcelTableBasedOnURI\*](#)
- [\*getExcelWorksheets\*](#)
- [\*getExcelWorksheetsBasedOnURI\*](#)
- [\*getExcelWorksheetsBasedOnStreamContext\*](#)
- [\*getChart\*](#)
- [\*getChartBasedOnURI\*](#)
- [\*getChartBasedOnStream\*](#)
- [\*getTable\*](#)
- [\*getTableBasedOnURI\*](#)
- [\*getTableBasedOnStreamContext\*](#)
- [\*getNamedRange\*](#)
- [\*getNamedRangeBasedOnURI\*](#)
- [\*getNamedRangeBasedOnStream\*](#)
- [\*getDynamicRange\*](#)
- [\*getDynamicRangeBasedOnURI\*](#)
- [\*getDynamicRangeBasedOnStream\*](#)

- *getVisioPagesInfo*
- *getVisioPagesInfoBasedOnURI*
- *getVisioPagesInfoBasedOnStreamContext*
- *getVisioPageOutput*
- *getVisioPageOutputBasedOnURI*
- *getVisioPageOutputBasedOnStreamContext*
- *getPowerPointSlidesInfo*
- *getPowerPointSlidesInfoBasedOnURI*
- *getPowerPointSlidesInfoBasedOnStreamContext*
- *getpowerPointSlideOutput*
- *getpowerPointSlideOutputBasedOnURI*
- *getpowerPointSlideOutputBasedOnStreamContext*
- *getPowerPointSlideRangeOutput*
- *getPowerPointSlideRangeOutputBasedOnURI*
- *getPowerPointSlideRangeOutputBasedOnStreamCongtext*

## getExcelChart

<b>Function</b>	Get a Microsoft Excel chart based on asset Id		
<b>Description</b>	This request returns a Microsoft Excel Chart in the desired image format. Default image format is PNG.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...ofice/excelchart/{assetId}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getExcelChart</code>		<code>com.quark.qpp.service.facade.Offi ceFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>assetId</code>	string	The AssetID.
	<code>majorversion=[x]</code>	string	Major version of the asset. (Optional)
	<code>minorversion=[x]</code>	string	Minor version of the asset. (Optional)
	<code>outputformat=[image, json, html]</code>	string	Image output format. (Optional)
	<code>contentdisposition</code>	string	Content disposition value to be set on the http response headers.
	<code>outputStream</code>	string	Output stream onto which output is to be written (for local API invocatins).
<b>Returns</b>	Returns a stream of the required format based on the given parameters.		
<b>Examples</b>	<b>URL:</b> <code>http://server:port/rest/service/office/excelchart/48?outputformat</code>		

## REST FRAMEWORK SERVICES

	<pre>=image&amp;imageformat=png</pre> <p><b>Results:</b></p> <p>A filestream of required output format based on given parameters.</p>
--	---

<b>Function</b>	Get a Microsoft Excel chart by path		
<b>Description</b>	This request returns a Microsoft Excel Chart in the desired image format. Default image format is PNG.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...ofice/excelchartbypath/{assetPath}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getExcelChart</code>		<code>com.quark.qpp.service.facade.OfficeByPathFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>assetPath</code>	string	The AssetPath.
	<code>majorversion=[x]</code>	string	Major version of the asset. (Optional)
	<code>minorversion=[x]</code>	string	Minor version of the asset. (Optional)
	<code>outputformat=[image, json, html]</code>	string	Image output format. (Optional)
	<code>contentdisposition</code>	string	Content disposition value to be set on the http response headers.
	<code>outputStream</code>	string	Output stream onto which output is to be written (for local API invocatins).
	<b>Returns</b>		
Returns a stream of the required format based on the given parameters.			
<b>Examples</b>	<b>URL:</b>		
	<code>http://server:port/rest/service/office/excelchartbypath/Home/Char1.xlsx?outputformat=image&amp;imageformat=png</code>		
	<b>Results:</b>		
A filestream of required output format based on given parameters.			

### getExcelChartBasedOnStream

<b>Function</b>	Get a Microsoft Excel chart based on stream		
<b>Description</b>	This request returns a Microsoft Excel Chart in the desired image format. Default image format is PNG.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>...ofice/excelchart</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getExcelChartBasedOnStream</code>		<code>com.quark.qpp.service.facade.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>inputStream</code>	string	The stream of the input file. (Mandatory)

	<code>outputformat=[image, json, html]</code>	string	Image output format. (Optional)
	<code>contentdisposition</code>	string	Content disposition value to be set on the http response headers.
	<code>outputStream</code>	string	Output stream onto which output is to be written (for local API invocatins).
<b>Returns</b>	Returns a stream of the required format based on the given parameters.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://server:port/rest/service/office/excelchart? outputformat=image&amp;imageformat=png</pre> <p><b>Results:</b></p> A filestream of required output format based on given parameters.		

**getExcelChartBasedOnURI**

<b>Function</b>	Get a Microsoft Excel chart based on URI		
<b>Description</b>	This request returns a Microsoft Excel Chart in the desired image format. Default image format is PNG.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...ofice/excelchart</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getExcelChartBasedOnURI</code>		<code>com.quark.qpp.service.facade.OfficeByPathFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>uri</code>	string	The URI of the Microsoft Excel chart
	<code>outputformat=[image, json, html]</code>	string	Image output format. (Optional)
	<code>contentdisposition</code>	string	Content disposition value to be set on the http response headers.
	<code>outputStream</code>	string	Output stream onto which output is to be written (for local API invocatins).
<b>Returns</b>	Returns a stream of the required format based on the given parameters.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://server:port/rest/service/office/excelchart? uri=qpp://assetsbypath/Home/Chart1.xlsx&amp;outputformat=image&amp;imageformat=png</pre> <p><b>Results:</b></p> A filestream of required output format based on given parameters.		

**getExcelTable**

<b>Function</b>	Get a Microsoft Excel table based on asset Id		
<b>Description</b>	This request returns a Microsoft Excel table in the desired output format. Default output format is Smart Table.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...ofice/exceltable/{assetId}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getExcelTable</code>		<code>com.quark.qpp.service.facade.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>assetId</code>	string	The AssetID.
	<code>majorversion=[x]</code>	string	Major version of the asset. (Optional)
	<code>minorversion=[x]</code>	string	Minor version of the asset. (Optional)
	<code>outputformat</code>	string	Output format. (Optional)
	<code>contentdisposition</code>	string	Content disposition value to be set on the http response headers.
	<code>outputStream</code>	string	Output stream onto which output is to be written (for local API invocatins).
<b>Returns</b>	Returns a stream of the required output format based on the given parameters.		
<b>Examples</b>	<b>URL:</b> <code>http://server:port/rest/service/office/exceltable/48?outputformat=image&amp;imageformat=png</code>		
	<b>Results:</b> A filestream of required output format based on given parameters.		

<b>Function</b>	Get a Microsoft Excel table by path		
<b>Description</b>	This request returns a Microsoft Excel table in the desired output format. Default output format is Smart Table.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...ofice/exceltablebypath/{assetPath}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getExcelTable</code>		<code>com.quark.qpp.service.facade.OfficeByPathFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>assetPath</code>	string	The AssetPath.
	<code>majorversion=[x]</code>	string	Major version of the asset. (Optional)
	<code>minorversion=[x]</code>	string	Minor version of the asset. (Optional)
	<code>outputformat</code>	string	Output format. (Optional)
	<code>contentdisposition</code>	string	Content disposition value to be set on the http response headers.

	<code>outputStream</code>	string	Output stream onto which output is to be written (for local API invocations).
<b>Returns</b>	Returns a stream of the required output format based on the given parameters.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://server:port/rest/service/office/exceltablebypath/Home/BudgetDetails.xlsx?outputformat=image&amp;imageformat=png</pre> <p><b>Results:</b></p> <p>A filestream of required output format based on given parameters.</p>		

### getExcelTableBasedOnStream

<b>Function</b>	Get a Microsoft Excel chartable art based on stream		
<b>Description</b>	This request returns a Microsoft Excel table in the desired output format. Default image format is PNG.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>...ofice/exceltable</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getExcelTableBasedOnStream</code>		<code>com.quark.qpp.service.facade.OfficeByPathFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>InputStream</code>	string	The stream of the input file. (Mandatory)
	<code>outputformat</code>	string	Output format. (Optional)
	<code>contentDisposition</code>	string	Content disposition value to be set on the http response headers.
	<code>outputStream</code>	string	Output stream onto which output is to be written (for local API invocations).
<b>Returns</b>	Returns a stream of the required output format based on the given parameters.		
<b>Examples</b>	<p><b>URL</b></p> <pre>http://server:port/rest/service/office/exceltable? outputformat=image&amp;imageformat=png</pre> <p><b>Results:</b></p> <p>A filestream of required output format based on given parameters.</p>		

### getExcelTableBasedOnURI

<b>Function</b>	Get a Microsoft Excel table based on URI		
<b>Description</b>	This request returns a Microsoft Excel table in the desired image format. Default output format is Smart Table.		
<b>Type</b>	GET		

## REST FRAMEWORK SERVICES

<b>URL Format</b>	<code>...ofice/excetable</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getExcelTableBasedOnURI</code>		<code>com.quark.qpp.service.facade.OfficeByPathFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>uri</code>	string	The URI of the Microsoft Excetable
	<code>outputformat</code>	string	Output format. (Optional)
	<code>contentdisposition</code>	string	Content disposition value to be set on the http response headers.
<b>Returns</b>	<code>outputStream</code>	string	Output stream onto which output is to be written (for local API invocatins).
	Returns a stream of the required output format based on the given parameters.		
	<b>URL:</b> <code>http://server:port/rest/service/office/excetable?uri=qpp://assetbypath/Home/BudgetDetails.xlsx&amp;outputformat=image&amp;imageformat=png</code>		
	<b>Results:</b> A filestream of required output format based on given parameters.		

### getExcelWorksheets

<b>Function</b>	Get all worksheets in Excel document.		
<b>Description</b>	This request returns all worksheets defined in an Excel document.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...office/excel/[assetId] OR .../ office/ excelbypath /{ coll name1}/{ coll name 2}/.../{asset name}</code>		
	<b>Method Name</b> <code>getExcelWorksheets</code>		<b>Class Name</b> <code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>majorversion=?</code>	string	Major version to be fetched. (Optional)
	<code>minorversion=?</code>	string	Minor version to be fetched. (Optional)
	<code>worksheets=?</code>	string	Comma separated worksheet names of specific worksheets to be fetched. (Optional)
<b>Returns</b>	Returns all worksheets or required worksheets defined in an Excel document. Each worksheet encapsulates its metadata (such as worksheet index and name.) Each worksheet also provides information about tables, named ranges and charts defined in the worksheet.		
<b>Examples</b>	<b>URL:</b> <code>http://serverName:serverPort/rest/service/office/excel/10</code>		

	<p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;worksheetInfoList&gt;   &lt;worksheetInfo index="0"&gt;     &lt;name&gt;Products&lt;/name&gt;     &lt;chartInfoList&gt;       &lt;chartInfo&gt;         &lt;name&gt;Chart 1&lt;/name&gt;       &lt;/chartInfo&gt;     &lt;/chartInfoList&gt;     &lt;namedRangeInfoList&gt;       &lt;namedRangeInfo&gt;         &lt;name&gt;Description&lt;/name&gt;       &lt;/namedRangeInfo&gt;       &lt;namedRangeInfo&gt;         &lt;name&gt;DispatchRange&lt;/name&gt;       &lt;/namedRangeInfo&gt;     &lt;/namedRangeInfoList&gt;   &lt;/worksheetInfo&gt;   &lt;worksheetInfo index="1"&gt;     &lt;name&gt;Sales&lt;/name&gt;     &lt;chartInfoList&gt;       &lt;chartInfo&gt;         &lt;name&gt;Chart 1&lt;/name&gt;       &lt;/chartInfo&gt;     &lt;/chartInfoList&gt;     &lt;tableInfoList&gt;       &lt;tableInfo&gt;         &lt;name&gt;SalesTable&lt;/name&gt;       &lt;/tableInfo&gt;     &lt;/tableInfoList&gt;   &lt;/worksheetInfo&gt; &lt;/worksheetInfoList&gt;</pre>
	<p><b>URL:</b></p> <pre>http://servername:serverport/rest/service/office/excel/10? worksheets=sales,sheet3</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;worksheetInfoList&gt;   &lt;worksheetInfo index="1"&gt;     &lt;name&gt;Sales&lt;/name&gt;     &lt;chartInfoList&gt;       &lt;chartInfo&gt;         &lt;name&gt;Chart 1&lt;/name&gt;       &lt;/chartInfo&gt;     &lt;/chartInfoList&gt;     &lt;tableInfoList&gt;       &lt;tableInfo&gt;         &lt;name&gt;SalesTable&lt;/name&gt;       &lt;/tableInfo&gt;     &lt;/tableInfoList&gt;   &lt;/worksheetInfo&gt;   &lt;worksheetInfo index="2"&gt;     &lt;name&gt;Sheet3&lt;/name&gt;   &lt;/worksheetInfo&gt; &lt;/worksheetInfoList&gt;</pre>

## REST FRAMEWORK SERVICES

### getExcelWorksheetsBasedOnURI

<b>Function</b>	Get all worksheets based on URI of the Excel document.		
<b>Description</b>	This request returns all worksheets defined in an Excel document.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...office/excel</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getExcelWorksheetsBasedOnURI</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>URI</code>	string	Excel document uri.
	<code>worksheets</code>	string	Comma separated worksheet names if specific worksheets are to be fetched. (Optional)
<b>Returns</b>	Returns all worksheets or required worksheets defined in an Excel document. Each worksheet encapsulates its metadata (such as worksheet index and name. Each worksheet also provides information about tables, named ranges and charts defined in the worksheet.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://serverName:serverPort/rest/service/office/excel? uri=file:C:\DATA\Documents\MyExcelSamples\DocSample.xlsx</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;worksheetInfoList &gt; &lt;worksheetInfo index="0"&gt; &lt;name&gt;Products&lt;/name&gt; &lt;chartInfoList&gt; &lt;chartInfo&gt; &lt;name&gt;Chart 1&lt;/name&gt; &lt;/chartInfo&gt; &lt;/chartInfoList&gt; &lt;namedRangeInfoList&gt; &lt;namedRangeInfo&gt; &lt;name&gt;Description&lt;/name&gt; &lt;/namedRangeInfo&gt; &lt;namedRangeInfo&gt; &lt;name&gt;DispatchRange&lt;/name&gt; &lt;/namedRangeInfo&gt; &lt;/namedRangeInfoList&gt; &lt;/worksheetInfo&gt; &lt;worksheetInfo index="1"&gt; &lt;name&gt;Sales&lt;/name&gt; &lt;tableInfoList&gt; &lt;tableInfo&gt; &lt;name&gt;SalesTable&lt;/name&gt; &lt;/tableInfo&gt; &lt;/tableInfoList&gt; &lt;/worksheetInfo&gt; &lt;/worksheetInfoList&gt;</pre>		

### getExcelWorksheetsBasedOnStreamContext

<b>Function</b>	Get all worksheets defined in an Excel document based on stream context.		
<b>Description</b>	This request returns all worksheets defined in an Excel document.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...office/excel</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getExcelWorksheetsBasedOnStreamContext</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>stream</code>	string	Excel document in request.
	<code>worksheets</code>	string	Comma separated worksheet names if

		specific worksheets are to be fetched. (Optional)
Returns	Returns all worksheets or required worksheets defined in an Excel document. Each worksheet encapsulates its metadata (such as worksheet index and name). Each worksheet also provides information about tables, named ranges and charts defined a worksheet.	
Examples	<p>URL:  <a href="http://serverName:serverPort/rest/service/office/excel">http://serverName:serverPort/rest/service/office/excel</a> Stream the excel document as input.</p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;worksheetInfoList&gt; &lt;worksheetInfo index="0"&gt; &lt;name&gt;Products&lt;/name&gt; &lt;chartInfoList&gt; &lt;chartInfo&gt; &lt;name&gt;Chart 1&lt;/name&gt; &lt;/chartInfo&gt; &lt;/chartInfoList&gt; &lt;namedRangeInfoList&gt; &lt;namedRangeInfo&gt; &lt;name&gt;Description&lt;/name&gt; &lt;/namedRangeInfo&gt; &lt;namedRangeInfo&gt; &lt;name&gt;DispatchRange&lt;/name&gt; &lt;/namedRangeInfo&gt; &lt;/namedRangeInfoList&gt; &lt;/worksheetInfo&gt; &lt;worksheetInfo index="1"&gt; &lt;name&gt;Sales&lt;/name&gt; &lt;tableInfoList&gt; &lt;tableInfo&gt; &lt;name&gt;SalesTable&lt;/name&gt; &lt;/tableInfo&gt; &lt;/tableInfoList&gt; &lt;/worksheetInfo&gt; &lt;/worksheetInfoList&gt;</pre>	

### getChart

Function	Get an Excel chart in image format.		
Description	This request returns an Excel chart in image format.		
Type	GET		
URL Format	<code>.../office/excel/[assetId] OR .../office/excelbypath/{coll name1}/{coll name 2}/.../{asset name}</code>		
Java API	Method Name		Class Name
	<code>getChart</code>		<code>com.quark.qpp.service.facadeClass OfficeFacade</code>
Parameters	Name	Type	Description
	<code>majorversion=?</code>	string	Major version of the asset. (Optional)
	<code>minorversion=?</code>	string	Minor version of the asset. (Optional)
	<code>chart</code>	string	Name of the Excel chart to be retrieved.
	<code>worksheet</code>	string	The name of the worksheet where the chart is defined. By default the first chart in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>horizontalresolution</code>	string	Image output horizontal resolution. (Optional)
	<code>verticalresolution</code>	string	Image output vertical resolution. (Optional)
	<code>imageformat</code>	string	Image output format. By default the image is returned in png format.

			(Optional)
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to “attachment” if downloading of chart is required. (Optional)
<b>Returns</b>	Returns an Excel chart in the image format.		
<b>Examples</b>	<p>URL:  <a href="http://serverName:serverPortt/rest/service/office/excel/36?chart=Chart1&amp;horizontalresolution=100&amp;verticalresolution=100&amp;imageformat/png">http://serverName:serverPortt/rest/service/office/excel/36?chart=Chart1&amp;horizontalresolution=100&amp;verticalresolution=100&amp;imageformat/png</a></p> <p>Result:</p>		

**getChartBasedOnURI**

<b>Function</b>	Get Excel chart based on the URI of the Excel document.		
<b>Description</b>	This request returns an Excel chart in the image format.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...office/excel</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getChartBasedOnURI</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>uri</code>	string	URI of the Excel document.
	<code>chart</code>	string	Name of the Excel chart to be retrieved.
	<code>worksheet</code>	string	The name of the worksheet where the chart is defined. By default the first chart in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>horizontalresolution</code>	string	Image output horizontal resolution. (Optional)
	<code>verticalresolution</code>	string	Image output vertical resolution. (Optional)
	<code>imageformat</code>	string	Image output format. By default the image is returned in png format. (Optional)
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to “attachment” if downloading of chart is required. (Optional)
<b>Returns</b>	Returns an Excel chart in the image format.		
<b>Examples</b>	<p>URL:  <a href="http://serverName:serverPortt/rest/service/office/excel?uri=">http://serverName:serverPortt/rest/service/office/excel?uri=</a></p>		

	classpath:SampleExcelFile.xlsx&worksheet=Products&chart=chart1&imageformat/png  Result:
--	---

**getChartBasedOnStream**

<b>Function</b>	Get a chart based on the input stream of an Excel document.		
<b>Description</b>	This request returns an Excel chart in the image format. Include the file in the request body or as file part.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...office/excel</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getChartBasedOnStream</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>chart</code>	string	Name of the Excel chart to be retrieved.
	<code>worksheet</code>	string	The name of the worksheet where the chart is defined. By default the first chart in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>horizontalresolution</code>	string	Image output horizontal resolution. (Optional)
	<code>verticalresolution</code>	string	Image output vertical resolution. (Optional)
	<code>imageformat</code>	string	Image output format. By default the image is returned in png format. (Optional)
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to "attachment" if downloading of chart is required. (Optional)
<b>Returns</b>	Returns an Excel chart in the image format.		
<b>Examples</b>	URL: <code>http://serverName:serverPort/rest/service/office/excel?worksheet=Products&amp;chart=chart1&amp;imageformat/png</code>  Result:		

**getTable**

<b>Function</b>	Get an Excel table.
<b>Description</b>	This request returns an Excel table in the desired output format.

## REST FRAMEWORK SERVICES

Type	GET		
URL Format	<code>..office/excel/[assetId] OR .../ office/ excelbypath /{ coll name1}/{ coll name 2}/.../{asset name}</code>		
Java API	Method Name		Class Name
	<code>getTable</code>		<code>com.quark.qpp.service.facadeClass</code> <code>OfficeFacade</code>
Parameters	Name	Type	Description
	<code>majorversion=?</code>	string	Major version to be retrieved. (Optional)
	<code>minorversion=?</code>	string	Minor version to be retrieved. (Optional)
	<code>table</code>	string	Name of the table to be retrieved. (Optional)
	<code>worksheets=?</code>	string	The name of the worksheet where the table is defined. By default the first table in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>outputformat</code>	string	Value of the output format in which the table is to be rendered. Possible values are defined in class <code>com.quark.qpp.office.service.constants.ExcelDataOutputFormats</code> . Default value is "smarttable".
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to "attachment" if downloading of table is required. (Optional)
Returns	Returns an Excel table in the desired output format.		
Examples	<p>URL:  <code>http://serverName:serverPort/rest/service/office/excel/10? worksheet=Products&amp;table=SalesDetails</code> Result:</p> <pre>&lt;?xml version="1.0" encoding="utf-8"?&gt;&lt;table xmlns ="http://quark.com/smartercontent/1.0" type=" smarttable "&gt;&lt;tgroup cols="2"&gt;&lt;colspec colnum ="1" colname ="1" colwidth ="64px"/&gt;&lt;colspec colnum ="2" colname ="2" colwidth ="131px"/&gt;&lt;tbody&gt;&lt;row&gt;&lt;entry valign ="bottom" colsep ="0" rowsep ="0"&gt;&lt;p&gt;&lt;t&gt;Name&lt;/t&gt;&lt;/p&gt;&lt;/entry&gt;&lt;entry valign ="bottom" colsep ="0" rowsep ="0"&gt;&lt;p&gt;&lt;t&gt;Sales (in millions)&lt;/t&gt;&lt;/p&gt;&lt;/entry&gt;&lt;/row&gt;&lt;/tbody&gt;&lt;/tgroup &gt;&lt;/table&gt;</pre>		

### getTableBasedOnURI

Function	Get an Excel table based on an Excel document URI.	
Description	This request returns an Excel table in the desired output format.	
Type	GET	
URL Format	<code>...office/excel</code>	
Java API	Method Name	Class Name

	<code>getTableBasedOnURI</code>		<code>com.quark.qpp.service.facadeClass</code> <code>OfficeFacade</code>
Parameters	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>uri</code>	string	URI of the Excel document.
	<code>table</code>	string	Name of the table to be retrieved. (Optional)
	<code>worksheets=?</code>	string	The name of the worksheet where the chart is defined. By default the first chart in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>outputformat</code>	string	Value of the output format in which the table is to be rendered. Possible values are defined in class <code>com.quark.qpp.office.service.constants.ExcelDataOutputFormats</code> . Default value is "smarttable".
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to "attachment" if downloading of chart is required. (Optional)
Returns	Returns an Excel table in the desired output format.		
Examples	<p>URL:  <code>http://serverName:serverPort/rest/service/office/excel? uri = classpath:SampleExcelFile.xlsx&amp;table = SalesDetails</code></p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="utf-8"?&gt; &lt;table xmlns ="http://quark.com/ smartcontent /1.0" type=" smarttable "&gt; &lt; tgroup cols="2"&gt; &lt; colspec colnum ="1" colname ="1" colwidth ="64px"/&gt; &lt; colspec colnum ="2" colname ="2" colwidth ="131px"/&gt; &lt; tbody &gt; &lt; row&gt; &lt; entry valign ="bottom" colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t&gt;Name&lt;/t&gt; &lt;/p&gt; &lt;/entry&gt; &lt; entry valign ="bottom" colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t&gt;Sales (in millions)&lt;/t&gt; &lt;/p&gt; &lt;/entry&gt; &lt;/row&gt; &lt;/ tbody &gt; &lt;/ tgroup &gt; &lt;/table&gt;</pre>		

### getTableBasedOnStreamContext

<b>Function</b>	Get an Excel table based on stream context.		
<b>Description</b>	This request returns an Excel table in the desired output format. Include the file in the request body or as file part.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/excel</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>getTableBasedOnStreamContext</code>	<code>com.quark.qpp.service.facadeClass</code> <code>OfficeFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>

	<code>table</code>	string	Name of the table to be retrieved. (Optional)
	<code>worksheets=?</code>	string	The name of the worksheet where the chart is defined. By default the first chart in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>outputformat</code>	string	Value of the output format in which the table is to be rendered. Possible values are defined in class com.quark.qpp.office.service.constants.ExcelDataOutputFormats . Default value is "smarttable".
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to "attachment" if downloading of chart is required. (Optional)
<b>Returns</b>	Returns an Excel table in the desired output format.		
<b>Examples</b>	<p>URL:</p> <p><code>http://serverName:serverPort/rest/service/office/excel ? worksheet= Products&amp;table = SalesInfo &amp; stream the Excel file in input</code></p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="utf-8"?&gt; &lt;table xmlns ="http://quark.com/ smartcontent /1.0" type=" smarttable "&gt; &lt; tgroup cols="2"&gt; &lt; colspec colnum ="1" colname ="1" colwidth ="64px"/&gt; &lt; colspec colnum ="2" colname ="2" colwidth ="131px"/&gt; &lt; tbody &gt; &lt;row&gt; &lt;entry valign ="bottom" colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t&gt;Name&lt;/t&gt; &lt;/p&gt; &lt;/entry&gt; &lt;entry valign ="bottom" colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t&gt;Sales (in millions)&lt;/t&gt; &lt;/p&gt; &lt;/entry&gt; &lt;/row&gt; &lt;/ tbody &gt; &lt;/ tgroup &gt; &lt;/table&gt;</pre>		

## getNamedRange

Function	Get an Excel Named Range.		
Description	This request returns an Excel named range in the desired output format.		
Type	GET		
URL Format	<code>.../office/excel/[assetId] OR .../ office/ excelbypath /{ coll name1}/{ coll name 2}/.../{asset name}</code>		
Java API	Method Name		Class Name
	<code>getNamedRange</code>		<code>com.quark.qpp.service.facadeClass OfficeFacade</code>
Parameters	Name	Type	Description
	<code>majorversion=?</code>	string	Major version to be retrieved. (Optional)
	<code>minorversion=?</code>	string	Minor version to be retrieved. (Optional)

	<code>namedrange</code>	string	Name of the Excel named range to be retrieved.
	<code>worksheets=?</code>	string	The name of the worksheet where the named ranged is defined. By default the first named ranged in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>outputformat</code>	string	Value of the output format in which the named range is to be rendered. Possible values are defined in class com.quark.qpp.office.service.constants.ExcelDataOutputFormats .
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to "attachment" if downloading of named range is required. (Optional)
<b>Returns</b>	Returns an Excel named range in the desired output format.		
<b>Examples</b>	<p>URL:  <a href="http://serverName:serverPort/rest/service/office/excel/10?worksheet=Products&amp;namedrange=DispatchRange">http://serverName:serverPort/rest/service/office/excel/10 ? worksheet= Products&amp; namedrange = DispatchRange</a></p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;table xmlns="http://quark.com/ smartcontent /1.0" type=" smarttable "&gt; &lt; tgroup cols="1"&gt; &lt; colspec colnum ="1" colname ="1" colwidth ="83x"/&gt; &lt; tbody &gt; &lt;row&gt; &lt;entry align="right" valign ="bottom" colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t&gt;10&lt;/t&gt; &lt;/p&gt; &lt;/entry&gt; &lt;/row&gt; ..... &lt;/ tbody &gt; &lt;/ tgroup &gt; &lt;/table&gt;</pre>		

### getNamedRangeBasedOnURI

<b>Function</b>	Get an Excel Named Range based on the URI of the Excel document.		
<b>Description</b>	This request returns an Excel named range in the desired output format.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/excel</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>getNamedRangeBasedOnURI</code>	<code>com.quark.qpp.service.facadeClass</code> <code>OfficeFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>uri</code>	string	Excel document URI.
	<code>namedrange</code>	string	Name of the Excel named range to be retrieved.
	<code>worksheets=?</code>	string	The name of the worksheet where the named ranged is defined. By default the first named ranged in Excel with the given name is returned if the worksheet is not

			mentioned. (Optional)
	<code>outputformat</code>	string	Value of the output format in which the named range is to be rendered. Possible values are defined in class com.quark.qpp.office.service.constants.ExcelDataOutputFormats .
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to "attachment" if downloading of named range is required. (Optional)
<b>Returns</b>	Returns an Excel named range in the desired output format.		
<b>Examples</b>	<p>URL:  <a href="http://serverName:serverPort/rest/service/office/excel?uri=classpath:SampleExcelFile.xlsx&amp;namedrange=DispatchRange">http://serverName:serverPort/rest/service/office/excel?uri=classpath:SampleExcelFile.xlsx&amp;namedrange=DispatchRange</a></p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;table xmlns="http://quark.com/ smartcontent /1.0" type=" smarttable "&gt;&lt; tgroup cols="1"&gt;&lt; colspec colnum ="1" colname ="1" colwidth ="83x"/&gt; &lt; tbody &gt;&lt; row &gt;&lt; entry align="right" valign ="bottom" colsep ="0" rowsep ="0"&gt;&lt;p&gt;&lt;t&gt;10&lt;/t&gt;&lt;/p&gt;&lt;/entry&gt; &lt;/row &gt; ..... &lt;/ tbody &gt;&lt;/ tgroup &gt;&lt;/table&gt;</pre>		

**getNamedRangeBasedOnStream**

<b>Function</b>	Get an Excel Named Range based on stream context.		
<b>Description</b>	This request returns an Excel named range in the desired output format. Include the file in the request body or as file part.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/excel</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getNamedRangeBasedOnStream</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>namedrange</code>	string	Name of the Excel named range to be retrieved.
	<code>worksheets=?</code>	string	The name of the worksheet where the named ranged is defined. By default the first named ranged in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>outputformat</code>	string	Value of the output format in which the named range is to be rendered. Possible values are defined in class com.quark.qpp.office.service.constants.ExcelDataOutputFormats .

	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to "attachment" if downloading of named range is required. (Optional)
<b>Returns</b>	Returns an Excel named range in the desired output format.		
<b>Examples</b>	<p>URL:  <a href="http://serverName:serverPort/rest/service/office/excel?worksheet=Sales&amp;namedrange=DispatchRange">http://serverName:serverPort/rest/service/office/excel? worksheet= Sales&amp;namedrange = DispatchRange</a> &amp; stream the Excel file in input</p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;table xmlns="http://quark.com/ smartcontent /1.0" type=" smarttable "&gt; &lt; tgroup cols="1"&gt; &lt; colspec colnum ="1" colname ="1" colwidth ="83x"/&gt; &lt; tbody &gt; &lt;row&gt; &lt;entry align="right" valign ="bottom" colsep ="0" rowsep ="0"&gt;&lt;p&gt;&lt;t&gt;10&lt;/t&gt;&lt;/p&gt; &lt;/entry&gt; &lt;/row&gt; ..... &lt;/ tbody &gt; &lt;/ tgroup &gt; &lt;/table&gt;</pre>		

### getDynamicRange

<b>Function</b>	Get an Excel Dynamic Range.		
<b>Description</b>	This request returns an Excel dynamic range in the desired output format.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/excel/[assetId]</code> OR <code>.../ office/ excelbypath /{ coll name1}/{ coll name 2}/.../{asset name}d</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getDynamicRange</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>majorversion=?</code>	string	Major version to be retrieved. (Optional)
	<code>minorversion=?</code>	string	Minor version to be retrieved. (Optional)
	<code>dynamicrange</code>	string	Name of the Excel dynamic range to be retrieved.
	<code>worksheets=?</code>	string	The name of the worksheet where the dynamic ranged is defined. By default the first dynamic ranged in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>outputformat</code>	string	Value of the output format in which the dynamic range is to be rendered. Possible values are defined in class <code>com.quark.qpp.office.service.constants.ExcelDataOutputFormats</code> .
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to "attachment" if downloading of dynamic range is required. (Optional)

<b>Returns</b>	Returns an Excel dynamic range in the desired output format.
<b>Examples</b>	<p>URL:</p> <pre>http://serverName:serverPort/rest/service/office/excel/1?worksheet=Sales&amp;dynamicrange=A2:C25</pre> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;table xmlns="http://quark.com/ smartcontent /1.0" type=" smarttable "&gt; &lt; tgroup cols="1"&gt; &lt; colspec colnum ="1" colname ="1" colwidth ="104px"/&gt; &lt; tbody &gt; &lt;row&gt; &lt;entry colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t/&gt; &lt;/p&gt; &lt;/entry&gt; &lt;/row&gt; &lt;row&gt; &lt;entry valign="bottom" colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t&gt;Product details&lt;/t&gt; &lt;/p&gt; &lt;/entry&gt; &lt;/row&gt; ..... &lt;/ tbody &gt; &lt;/ tgroup &gt; &lt;/table&gt;</pre>

**getDynamicRangeBasedOnURI**

<b>Function</b>	Get an Excel Dynamic Range based on the URI of the Excel document.		
<b>Description</b>	This request returns an Excel dynamic range in the desired output format.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/excel</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getDynamicRangeBasedOnURI</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>uri</code>	string	Excel document URI.
	<code>dynamicrange</code>	string	Name of the Excel dynamic range to be retrieved.
	<code>worksheets=?</code>	string	The name of the worksheet where the dynamic ranged is defined. By default the first dynamic ranged in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>outputformat</code>	string	Value of the output format in which the dynamic range is to be rendered. Possible values are defined in class <code>com.quark.qpp.office.service.constants.ExcelDataOutputFormats</code> .
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to "attachment" if downloading of named range is required. (Optional)
<b>Returns</b>	Returns an Excel dynamic range in the desired output format.		
<b>Examples</b>	<p>URL:</p> <pre>http://serverName:serverPort/rest/service/office/excel? uri = classpath:SampleExcelFile.xlsx&amp;worksheet = Sales&amp;dynamicrange =A2:C25</pre>		

	<p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;table xmlns="http://quark.com/ smartcontent /1.0" type=" smarttable "&gt;&lt; tgroup cols="1"&gt;&lt; colspec colnum ="1" colname ="1" colwidth ="104px"/&gt; &lt; tbody &gt; &lt; row &gt; &lt; entry colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t/&gt; &lt;/p&gt; &lt;/entry&gt; &lt;/row&gt; &lt; row &gt; &lt; entry valign="bottom" colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t&gt;Product details&lt;/t&gt; &lt;/p&gt; &lt;/entry&gt; &lt;/row&gt; ..... &lt;/ tbody &gt; &lt;/ tgroup &gt; &lt;/table&gt;</pre>
--	---

### getDynamicRangeBasedOnStream

<b>Function</b>	Get an Excel Dynamic Range based on stream context.		
<b>Description</b>	This request returns an Excel dynamic range in the desired output format. Include the file in the request body or as file part.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>...office/excel</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getDynamicRangeBasedOnStream</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>dynamicrange</code>	string	Name of the Excel dynamic range to be retrieved.
	<code>worksheet=?</code>	string	The name of the worksheet where the dynamic ranged is defined. By default the first named ranged in Excel with the given name is returned if the worksheet is not mentioned. (Optional)
	<code>outputformat</code>	string	Value of the output format in which the dynamic range is to be rendered. Possible values are defined in class <code>com.quark.qpp.office.service.constants.ExcelDataOutputFormats</code> .
	<code>contentDisposition</code>	string	Used to set the content-disposition header value in the response. Set to "attachment" if downloading of named range is required. (Optional)
<b>Returns</b>	Returns an Excel dynamic range in the desired output format.		
<b>Examples</b>	<p>URL:  <code>http://serverName:serverPort/rest/service/office/excel? worksheet=Sales&amp;dynamicrange=r1c1:r5c5 &amp; stream</code> the Excel file in input</p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;table xmlns="http://quark.com/ smartcontent /1.0" type=" smarttable "&gt;&lt; tgroup cols="1"&gt;&lt; colspec colnum ="1" colname ="1" colwidth ="104px"/&gt; &lt; tbody &gt; &lt; row &gt; &lt; entry colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t/&gt; &lt;/p&gt; &lt;/entry&gt; &lt;/row&gt; &lt; row &gt; &lt; entry valign="bottom" colsep ="0" rowsep ="0"&gt; &lt;p&gt; &lt;t&gt;Product details&lt;/t&gt; &lt;/p&gt; &lt;/entry&gt; &lt;/row&gt; ..... &lt;/ tbody &gt; &lt;/ tgroup &gt; &lt;/table&gt;</pre>		

## REST FRAMEWORK SERVICES

	= "bottom" colsep = "0" rowsep = "0">> <p> <t>Product details</t> </p> </entry></row> ..... ..... </ tbody > </ tgroup > </table>
--	---

### getVisioPagesInfo

<b>Function</b>	Get metadata of all pages of a Visio asset.		
<b>Description</b>	This request returns all pages defined within a Visio document. To retrieve specific pages, specify a valid page name in the pages parameter.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/visio/[assetId]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getVisioPagesInfo</code>		<code>com.quark.qpp.service.facadeClass</code> <code>OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>majorversion</code> and <code>minorversion</code>	string	Specify the required major and minor version for which the pages of an asset is required. (Optional) These parameters will be used collectively. If neither parameter is passed, the latest version of the asset will be considered. If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
	<code>pageNames= [comma-separated list of page names]</code>	string	The set of page names.
<b>Returns</b>	Returns a <code>VisioPageInfoList</code> object that contains index number and page name of all pages of a given Visio asset.		
<b>Examples</b>	URL: <code>http://serverName:serverPort/rest/service/office/visio/{assetId}</code>		
	Result:  A VisioPageInfoList object that contains index number and page name of all pages of a given Visio asset.<?xml version="1.0" encoding="UTF-8" standalone="yes"?><visioPageInfoList> <visioPageInfo index="1"> <pageName>Page-1</pageName> </visioPageInfo> </visioPageInfoList>		

### getVisioPagesInfoBasedOnURI

<b>Function</b>	Get metadata of all pages of a Visio asset based on URI.	
<b>Description</b>	This request returns all pages defined within a Visio document. To retrieve specific pages, specify a valid page name in the pages parameter.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../office/visio</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>

	getVisioPagesInfoBasedOnURI		com.quark.qpp.service.facadeClass OfficeFacade
Parameters	Name	Type	Description
	Uri	string	The URI of the asset. (Mandatory)
	pageNames= [comma-separated list of page names]	string	The set of page names.
Returns	Returns a VisioPageInfoList object that contains index number and page name of all pages of a given Visio asset.		
Examples	<p>URL:</p> <p>http://serverName:serverPort/rest/service/office/visio?uri=qpp://assets/{assetId}</p> <p>Result:</p> <p>A VisioPageInfoList object that contains index number and page name of all pages of a given Visio asset.&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;&lt;visioPageInfoList&gt; &lt;visioPageInfo index="1"&gt; &lt;pageName&gt;Page-1&lt;/pageName&gt; &lt;/visioPageInfo&gt; &lt;/visioPageInfoList&gt;</p>		

**getVisioPagesInfoBasedOnStreamContext**

Function	Get metadata of all pages of a Visio asset based on stream.		
Description	This request returns all pages defined within a Visio document. To retrieve specific pages, specify a valid page name in the pages parameter. Include the file in the request body or as a file part. (Mandatory)		
Type	GET		
URL Format	.../office/visio		
Java API	Method Name		Class Name
	getVisioPagesInfoBasedOnStreamContext		com.quark.qpp.service.facadeClass OfficeFacade
Parameters	Name	Type	Description
	pageNames= [comma-separated list of page names]	string	The set of page names.
Returns	Returns a VisioPageInfoList object that contains index number and page name of all pages of a given Visio asset.		
Examples	<p>URL:</p> <p>http://serverName:serverPort/rest/service/office/visioInclude the file in the request body.</p> <p>Result:</p> <p>A VisioPageInfoList object that contains index number and page name of all pages of a given Visio asset.&lt;visioPageInfoList&gt; &lt;visioPageInfo index="1"&gt; &lt;pageName&gt;Page-1&lt;/pageName&gt; &lt;/visioPageInfo&gt; &lt;/visioPageInfoList&gt;</p>		

**getVisioPageOutput**

<b>Function</b>	Get page output of a Visio asset.		
<b>Description</b>	This request returns a Visio document page output in the desired output format.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/visio/{assetId}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getVisioPageOutput</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>majorversion</code> and <code>minorversion</code>	string	Specify the required major and minor version for which the pages of an asset is required. (Optional) These parameters will be used collectively. If neither parameter is passed, the latest version of the asset will be considered. If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
	<code>pagename=</code> [comma-separated list of page names]	string	The set of page names.
<b>Returns</b>	Returns a filestream of required output format based on given parameters.		
<b>Examples</b>	<p>URL:  <code>http://serverName:serverPort/rest/service/office/visio/{assetId}?</code>  <code>outputformat=image&amp;pagename={pageName}&amp;imageformat=PNG</code></p> <p>Result:  A filestream of the generated output of the given asset.</p>		

**getVisioPageOutputBasedOnURI**

<b>Function</b>	Get metadata of all pages of a Visio asset based on URI.		
<b>Description</b>	This request returns a Visio document page output in the desired output format.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/visio</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getVisioPagesOutputBasedOnURI</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>Uri</code>	string	The URI of the asset. (Mandatory)
	<code>pagename=</code> [comma-separated list of page names]	string	The set of page names.
<b>Returns</b>	Returns a <code>VisioPageInfoList</code> object that contains index number and page name		

	of all pages of a given Visio asset.
Examples	<p>URL:</p> <pre>http://serverName:serverPort/rest/service/office/visio? uri=qpp://assets/{assetId}&amp;outputformat=image&amp;pagename={pageName}&amp;imageformat=PNG</pre> <p>Result:</p> <p>A filestream of the generated output of the given asset.</p>

### getVisioPageOutputBasedOnStreamContext

Function	Get page output of a Visio asset based on stream.		
Description	This request returns a Visio document page output in the desired output format. Include the file in the request body or as a file part. (Mandatory)		
Type	GET		
URL Format	<code>.../office/visio</code>		
Java API	Method Name		Class Name
	<code>getVisioPageOutputBasedOnStreamContext</code>		<code>com.quark.qpp.service.facadeClassOfficeFacade</code>
Parameters	Name	Type	Description
	pagename	string	The page name.
Returns	Returns a filestream of the required output format based on the given parameters.		
Examples	<p>URL:</p> <pre>http://serverName:serverPort/rest/service/office/visio/ outputformat=image&amp;pagename={pageName}&amp;imageformat=PNG</pre> <p>Include the file in the request body.</p> <p>Result:</p> <p>A filestream of the generated output of the given asset.</p>		

### getPowerPointSlidesInfo

Function	Get metadata of all slides of a PowerPoint asset.		
Description	This request returns all slides defined within a PowerPoint document. To retrieve specific slides, specify a valid slide index in the slideIndexes parameter.		
Type	GET		
URL Format	<code>.../office/powerpoint/[assetId]</code>		
Java API	Method Name		Class Name
	<code>getPowerPointSlidesInfo</code>		<code>com.quark.qpp.service.facadeClassOfficeFacade</code>
Parameters	Name	Type	Description

	<code>majorversion</code> and <code>minorversion</code>	string	Specify the required major and minor version for which the pages of an asset is required. (Optional) These parameters will be used collectively. If neither parameter is passed, the latest version of the asset will be considered. If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
	<code>slideIndexes= [comma-separated list of slide indexes]</code>	string	The set of slide indexes.
<b>Returns</b>	Returns a <code>PowerPointSlidesInfoList</code> object that contains index numbers and slide IDs of all slides for a given PowerPoint asset.		
<b>Examples</b>	<p>URL:  <code>http://serverName:serverPort/rest/service/office/powerpoint{assetId}</code></p> <p>Result:</p> <pre>A PowerPointSlidesInfoList object that contains index numbers and slide IDs for all slides of a given PowerPoint asset.&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;powerPointSlideInfoList&gt; &lt;powerPointSlideInfo index="1"&gt; &lt;slideId&gt;256&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="2"&gt; &lt;slideId&gt;257&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="3"&gt; &lt;slideId&gt;258&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="4"&gt; &lt;slideId&gt;259&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="5"&gt; &lt;slideId&gt;260&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;/powerPointSlideInfoList&gt;</pre>		

**getPowerPointSlidesInfoBasedOnURI**

<b>Function</b>	Get metadata of all slides of a PowerPoint asset based on URI.		
<b>Description</b>	This request returns all slides defined within a PowerPoint document. To retrieve specific slides, specify a valid slide id in the slideIndexes parameter.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/powerpoint</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getPowerPointSlidesInfoBasedOnURI</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>Uri</code>	string	The URI of the asset. (Mandatory)
	<code>slideIndexes= [comma-separated list of slide index numbers]</code>	string	The set of index number.
<b>Returns</b>	Returns a <code>PowerPointSlidesInfoList</code> object that contains index numbers and slide IDs for all slides of a given PowerPoint asset.		
<b>Examples</b>	<p>URL:</p>		

	<p>http://serverName:serverPort/rest/service/office/powerpoint? uri=qpp://assets/{assetId}</p> <p>Result:</p> <p>A PowerPointSlidesInfoList object that contains index numbers and slide IDs for all slides of a given PowerPoint asset.</p>
--	--

### getPowerPointSlidesInfoBasedOnStreamContext

<b>Function</b>	Get all slide metadata for a PowerPoint asset based on file stream.		
<b>Description</b>	This request returns all slides defined within a PowerPoint document. To retrieve specific slides, specify a valid index of a slide in the slideIndexes parameter. Include the file in the request body or as a file part. (Mandatory)		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/powerpoint</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getPowerPointSlidesInfoBasedOn StreamContext</code>		<code>com.quark.qpp.service.facadeClass OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>slideIndexes= [comma-separated list of slide indexes]</code>	string	The set of slide ids.
<b>Returns</b>	Returns a <code>PowerPointSlideInfoList</code> object that contains index numbers and slide IDs for all slides of a given PowerPoint asset.		
<b>Examples</b>	<p>URL: <code>http://serverName:serverPort/rest/service/office/powerpoint</code>Include the file in the request body.</p> <p>Result:</p> <p>A PowerPointSlideInfoList object that contains index numbers and slide ids of all slides of a given PowerPoint asset.&lt;powerPointSlideInfoList&gt; &lt;powerPointSlideInfo index="1"&gt; &lt;slideId&gt;256&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="2"&gt; &lt;slideId&gt;257&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="3"&gt; &lt;slideId&gt;258&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="4"&gt; &lt;slideId&gt;259&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;powerPointSlideInfo index="5"&gt; &lt;slideId&gt;260&lt;/slideId&gt; &lt;/powerPointSlideInfo&gt; &lt;/powerPointSlideInfoList&gt;</p>		

### getPowerPointSlideOutput

<b>Function</b>	Get slide output of a PowerPoint asset.
<b>Description</b>	This request extracts PowerPoint slide output in the specified format.
<b>Type</b>	GET
<b>URL Format</b>	<code>.../office/powerpoint/[assetId]</code>

<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getPowerPointSlidesOutput</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>majorversion</code> and <code>minorversion</code>	string	Specify the required major and minor version for which the slide of an asset is required. (Optional) These parameters will be used collectively. If neither parameter is passed, the latest version of the asset will be considered. If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
	<code>slideid</code>	string	The slide Id.
<b>Returns</b>	Returns a filestream that contains the required output format based on the given parameters.		
	URL: <code>http://server:port/rest/service/office/powerpoint/{assetId}</code> <code>?outputformat=image&amp;slideid={slideId}&amp;imageformat=PNG</code>		
	Result: Returns a filestream that contains the required output format based on the given parameters.		
<b>Examples</b>			

### getPowerPointSlideOutputBasedOnURI

<b>Function</b>	Get slide output of a PowerPoint asset based on URI.		
<b>Description</b>	This request extracts the PowerPoint slide output in the desired output format..		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/powerpoint</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getPowerPointSlideOutputBasedOnURI</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>Uri</code>	string	The URI of the asset. (Mandatory)
	<code>slideid</code>	string	The slide Id.
<b>Returns</b>	Returns a filestream that contains the required output format based on the given parameters.		
	URL:		

	<p>http://server:port/rest/service/office/powerpoint ?uri=qpp://assets/{assetId}&amp;outputformat=image&amp;slideid={slideId}&amp;imageformat=PNG</p> <p>Result:</p> <p>Returns a filestream that contains the required output format based on the given parameters.</p>
--	--

### getPowerPointSlideOutputBasedOnStreamContext

<b>Function</b>	Get slide output of a PowerPoint asset based on file stream.		
<b>Description</b>	This request extracts the PowerPoint slide output in the desired output format.. Include the file in the request body or as a file part. (Mandatory)		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/powerpoint</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getPowerPointSlideOutputBasedOnStreamContext</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>slideid</code>	string	The slide Id.
	<code>outputformat</code>	string	The desired output format.
<b>Returns</b>	Returns a filestream that contains the required output format based on the given parameters.		
<b>Examples</b>	<p>URL: <code>http://server:port/rest/service/office/powerpoint?</code> outputformat=image&amp;slideid={slideId}&amp;imageformat=PNGInclude the file in the request body.</p> <p>Result:</p> <p>Returns a filestream that contains the required output format based on the given parameters.</p>		

### getPowerPointSlideRangeOutput

<b>Function</b>	Get slide range output of a PowerPoint asset.		
<b>Description</b>	This request extracts the PowerPoint slide output in the desired output format.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/powerpoint/[assetId]</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getPowerPointSlideRangeOutput</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>majorversion</code> and	string	Specify the required major and minor

	<code>minorversion</code>		version for which the slide of an asset is required. (Optional) These parameters will be used collectively. If neither parameter is passed, the latest version of the asset will be considered. If only one of the parameters is not passed, then the value for that parameter is assumed to be 0.
	<code>sliderange = [comma-separated list of slide indexes]</code>	string	The set of slide indexes.
	<code>outputformat</code>	string	The desired output format.
<b>Returns</b>	Returns a filestream that contains the required output format based on the given parameters.		
<b>Examples</b>	<p>URL:</p> <pre>http://server:port/rest/service/office/powerpoint/{assetId} ?outputformat=image&amp;sliderange=1,3,5&amp;imageformat=PNG</pre> <p>Result:</p> <p>Returns a filestream that contains the required output format based on the given parameters.</p>		

**getPowerPointSlideRangeOutputBasedOnURI**

<b>Function</b>	Get slide range output of a PowerPoint asset based on URI.		
<b>Description</b>	This request extracts the PowerPoint slide output in the desired output format..		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/powerpoint</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getPowerPointSliderRangeOutputBasedOnURI</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>Uri</code>	string	The URI of the asset. (Mandatory)
	<code>sliderange = [comma-separated list of slide indexes]</code>	string	The set of slide indexes.
	<code>outputformat</code>	string	The desired output format.
<b>Returns</b>	Returns a filestream that contains the required output format based on the given parameters.		
<b>Examples</b>	<p>URL:</p> <pre>http://server:port/rest/service/office/powerpoint ?uri=qpp://assets/{assetId}&amp;outputformat=image&amp;sliderange=1,3,5&amp;imageformat=PNG</pre> <p>Result:</p>		

	Returns a filestream that contains the required output format based on the given parameters.
--	--

**getPowerPointSlideRangeOutputBasedOnStreamContext**

<b>Function</b>	Get slide range output of a PowerPoint asset based on file stream.		
<b>Description</b>	This request extracts the PowerPoint slide output in the desired output format.. Include the file in the request body or as a file part. (Mandatory)		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../office/powerpoint</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getPowerPointSlideRangeOutputBasedOnStreamContext</code>		<code>com.quark.qpp.service.facadeClass.OfficeFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>sliderange</code> = [comma-separated list of slide indexes]	string	The set of slide indexes.
	<code>outputformat</code>	string	The desired output format.
<b>Returns</b>	Returns a filestream that contains the required output format based on the given parameters.		
<b>Examples</b>	<p>URL:  <code>http://server:port/rest/service/office/powerpoint?</code>  <code>sliderange=1,3,5&amp;imageformat=PNG</code>Include the file in the request body.</p> <p>Result:      Returns a filestream that contains the required output format based on the given parameters.</p>		

**Charting**

The charting capabilities of the API includes the following REST calls:

- [\*getChart\*](#)
- [\*getChartBasedOnUri\*](#)
- [\*getChartBasedOnStream\*](#)

**getChart**

<b>Function</b>	Create new chart.	
<b>Description</b>	This request draws a chart for the given asset using the specified template.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>...charts/{assetId}</code> or <code>.../chartsbypath/[asset path]</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>

## REST FRAMEWORK SERVICES

	getChart		com.quark.qpp.service.facadeClass ChartingFacade
<b>Parameters</b>	Name	Type	Description
	assetId	string	The AssetID.
	majorversion=[x]	string	Major version of the asset. (Optional)
	minorversion=[x]	string	Minor version of the asset. (Optional)
	templateuri=[x]	string	Uri for the template file.
	outputformat=[image, json, html]	string	Image output format. (Optional)
Returns	Returns a stream of the successfully created chart.		
Examples	<p>URL:  <a href="http://serverName:serverPortt/rest/service/charts/408?templateuri=qpp://assets/409&amp;outputformat=html">http://serverName:serverPortt/rest/service/charts/408?templateuri=qpp://assets/409&amp;outputformat=html</a></p> <p>Result:  The file stream of the successfully created chart.</p>		

### getChartBasedOnUri

Function	Create new chart By URI.		
Description	This request draws a chart for the given data specified in the URI using the specified template.		
Type	GET		
URL Format	...charts/		
Java API	Method Name		Class Name
	getChartBasedOnURI		com.quark.qpp.service.facadeClass ChartingFacade
<b>Parameters</b>	Name	Type	Description
	uri=[x]	string	The URI for the source asset.
	majorversion=[x]	string	Major version of the asset. (Optional)
	minorversion=[x]	string	Minor version of the asset. (Optional)
	templateuri=[x]	string	Uri for the template file.
	outputformat=[image, json, html]	string	Image output format. (Optional)File, ClassPath, Http, Qpp are the supported URIs.
Returns	Returns a stream of the successfully created chart.		
Examples	<p>URL:  <a href="http://serverName:serverPortt/rest/service/charts?uri=qpp://assets/408&amp;templateuri=qpp://assets/409&amp;outputformat=htm">http://serverName:serverPortt/rest/service/charts?uri=qpp://assets/408&amp;templateuri=qpp://assets/409&amp;outputformat=htm</a></p> <p>Result:  The file stream of the successfully created chart.</p>		

**getChartBasedOnStream**

<b>Function</b>	Create new chart By Stream		
<b>Description</b>	This request draws a chart for the given data input stream using the specified template. Include the file in the request body or as file part.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../charts/</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getChartBasedOnStream</code>		<code>com.quark.qpp.service.facadeClass</code> <code>ChartingFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>majorversion=[x]</code>	string	Major version of the asset. (Optional)
	<code>minorversion=[x]</code>	string	Minor version of the asset. (Optional)
	<code>templateuri=[x]</code>	string	Uri for the template file.
	<code>outputformat=[image, json, html]</code>	string	Image output format. (Optional)File, ClassPath, Http, Qpp are the supported URIs
<b>Returns</b>	Returns a stream of the successfully created chart.		
<b>Examples</b>	<p>URL:  <code>http://serverName:serverPort/rest/service/charts?templateuri=qpp://assets/409&amp;outputformat=html</code></p> <p>Result:  The file stream of the successfully created chart.</p>		

**Configuration**

The Configuration service is used to manage the publishing configuration (adding/updating new publishing channels, processes and MIME types) and is responsible for the following:

- Managing the configuration files.
- Capturing updates.
- Reinitializing corresponding bean definitions.

In a multi-server environment, each node in a cluster must have access to a single .ext folder and the shared location must be appended to the classpth system environment variable.

POST requests only alter config files on a configured app server node. Multi-server deployments can leverage a shared file system location for the config files and avoid needing to manually maintain multiple sets of files on various application servers.

The `reInitialize` call can be used to avoid restarts even after changing the configuration files manually on the server .

The configuration capabilities of the API includes the following REST calls:

## REST FRAMEWORK SERVICES

- *getAllXmlMimeTypes*
- *getXmlMimeType*
- *createXmlMimeType*
- *getMappedMimeTypes*
- *mapMimeTypes*
- *unmapMimeTypes*
- *deleteXmlMimeType*
- *getPublishingProcess*
- *createPublishingProcess*
- *deletePublishingProcess*
- *getAllPublishingChannelDefinitions*
- *getPublishingChannelDefinition*
- *getPublishingChannelDefinitions*
- *createPublishingChannels*

- *deleteContentChannelMappings*
- *createIndexingChannelMapping*
- *getMappedIndexingChannel*
- *deleteIndexingChannelMapping*
- *deletePublishingChannels*
- *getDeploymentProperties*
- *getDeploymentVersion*
- *reInitialize*

### getAllXmlMimeTypes

<b>Function</b>	Get XML MimeTypes	
<b>Description</b>	This request returns all XML MimeTypes that exist on the server.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../config/xmlmimetypes</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllXmlMimeType</code>	<code>com.quark.qpp.service.facade.ConfigurationFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns the definitions of all xml mime-types.	
<b>Examples</b>	URL:	

	<p>http://serverName:serverPort/rest/service/config/xmlmimetypes</p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;mimeTypeInfoList&gt; &lt;mimeTypeInfo type="application/xml; format=smarttable" parentMimeType ="application/xml;"&gt; &lt;xpath&gt;/*[local-name()='table']/@type='smarttable'&lt;/xpath&gt; &lt;/mimeTypeInfo&gt; &lt;mimeTypeInfo type="application/xml; format=auxiliarydictionary" parentMimeType="format=hyphenationexceptions"&gt; &lt;xpath&gt;/*[local-name()='Dictionary']/@Type='AuxiliaryDictionary'&lt;/xpath&gt; &lt;/mimeTypeInfo&gt; &lt;mimeTypeInfo type="application/dita+xml; format=busdoc" parentMimeType="application/dita+xml; format=topic"&gt; &lt;pi name="Xpress"&gt;productLine="busdoc"&lt;/pi&gt; &lt;/mimeTypeInfo&gt; &lt;mimeTypeInfo type="application/xml; format=smartdoc" parentMimeType="application/xml; format=smartcontent"&gt; &lt;xpath&gt;/*[local- name()='section']/@type='document'&lt;/xpath&gt; &lt;/mimeTypeInfo&gt; &lt;mimeTypeInfo type="application/xml; format=smartsection" parentMimeType="application/xml; format= smartcontent"&gt; &lt;xpath&gt;/*[local-name()='section']/@type='section'&lt;/xpath&gt; &lt;/mimeTypeInfo&gt; &lt;/mimeTypeInfoList&gt;</pre>
--	--

### getXmlMimeType

<b>Function</b>	Get XML Mime Type		
<b>Description</b>	This request returns a specified XML Mime Type.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../config/xmlmimetypes</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getXmlMimeType</code>		<code>com.quark.qpp.service.facade</code> <code>Class ConfigurationFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>Mimetype</code>	string	The desired Mime Type. (Mandatory)
<b>Returns</b>	Returns the definition of the desired XML Mime Type, including the parent Mime Type, xpath and the processing instruction name and value based on which given Mime Type is detected.		
<b>Examples</b>	<p>URL:</p> <p><code>http://serverName:serverPort/rest/service/config/xmlmimetypes?</code> <code>mimetype=application/xml; format=researchreport</code></p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;mimeTypeInfoList&gt; &lt;mimeTypeInfo type="application/xml; format=researchreport" parentMimeType="application/xml; format= smartcontent"&gt; &lt;xpath&gt;/*[local- name()='section']/@type='researchreport'&lt;/xpath&gt; &lt;/mimeTypeInfo&gt; &lt;/mimeTypeInfoList&gt;</pre>		

**createXmlMimeType**

<b>Function</b>	Create a custom XML MimeType.		
<b>Description</b>	This request creates a MimeType for an XML document.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../config/xmlmimetypes</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createXmlMimeType</code>		<code>com.quark.qpp.service.facade.ConfigurationFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>mimetype</code>	string	The MimeType to be created. (Mandatory)
	<code>parent mimetype</code>	string	The parent MimeType. (Mandatory)
	<code>xpath</code>	string	The xPath. (It is mandatory to specify either the xPath or the piName and piValue.)
	<code>pi name</code>	string	The processing instruction. (It is mandatory to specify either the xPath or the piName and piValue.)
	<code>pi value</code>	string	The processing value. (It is mandatory to specify either the xPath or the piName and piValue.)
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<p>URL:</p> <pre>http://serverName:serverPort/rest/service/config/xmlmimetypes? op=create&amp;mimetype=application/xml; format=researchreport&amp;parentmimetype=application/xml; format=smartcontent&amp;xpath='*[local-name()="section"]'@type='researchreport'</pre>		

**getMappedMimeTypes**

<b>Function</b>	Get mapped MimeTypes		
<b>Description</b>	This request returns a list of MimeTypes mapped to the given content type.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../config/xmlmimetypes</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getMappedMimeTypes</code>		<code>com.quark.qpp.service.facade.ConfigurationFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>contenttype</code>	string	The content type. (Mandatory)
<b>Returns</b>	Returns a <code>mimeTypeInfoList</code> object that contains the metadata of all mimeTypes		

	mapped to the given content type.
Examples	<p>URL:  <a href="http://serverName:serverPort/rest/service/config/xmlmimetypes?contenttype=Research Report">http://serverName:serverPort/rest/service/config/xmlmimetypes?contenttype=Research Report</a></p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;mimeTypeInfoList&gt; &lt;mimeTypeInfo type="application/xml; format=researchreport" parentMimeType="application/xml; format= smartcontent"&gt; &lt;xpath&gt;/*[local- name()='section']/@type='researchreport'&lt;/xpath&gt; &lt;/mimeTypeInfo&gt; &lt;/mimeTypeInfoList&gt;</pre>

### mapMimeTypes

Function	Map custom XML MimeType with ContentType.		
Description	This request maps a content type to a list of mime types.		
Type	POST		
URL Format	<a href=".../config/xmlmimetypes">.../config/xmlmimetypes</a>		
Java API	Method Name		Class Name
	<a href="#">mapMimeTypes</a>		<a href="#">com.quark.qpp.service.facade.ConfigurationFacade</a>
Parameters	Name	Type	Description
	<a href="#">op=mapcontenttype</a>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<a href="#">contenttype=[contentTypeOrName]</a>	string	The content type to be mapped. (Mandatory)
	<a href="#">mimetypes</a>	string	The mimetypes to be mapped. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<p>URL:  <a href="http://serverName:serverPort/rest/service/config/xmlmimetypes?op=mapcontenttype&amp;contenttype=Research Report&amp;mimetypes=application/xml;format=researchreport">http://serverName:serverPort/rest/service/config/xmlmimetypes?op=mapcontenttype&amp;contenttype=Research Report&amp;mimetypes=application/xml;format=researchreport</a></p>		

### unmapMimeTypes

Function	Unmap custom XML MimeType with ContentType.		
Description	This request deletes the content type mappings for given mime types.		
Type	POST		
URL Format	<a href=".../config/xmlmimetypes">.../config/xmlmimetypes</a>		
Java API	Method Name		Class Name
	<a href="#">unmapMimeTypes</a>		<a href="#">com.quark.qpp.service.facade</a>

## REST FRAMEWORK SERVICES

			Class ConfigurationFacade
Parameters	Name	Type	Description
	op=unmapcontenttype	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	mimetypes	string	The mimetypes to be unmapped. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	URL: <a href="http://serverName:serverPort/rest/service/config/xmlmimetypes?op=unmapcontenttype&amp;mimetypes=application/xml; format=researchreport">http://serverName:serverPort/rest/service/config/xmlmimetypes?op=unmapcontenttype&amp;mimetypes=application/xml; format=researchreport</a>		

### deleteXmlMimeType

Function	Delete custom XML MimeType.		
Description	This request deletes an xml mime type and if this mime type is mapped to a content type, that mapping is also deleted.		
Type	POST		
URL Format	<a href=".../config/xmlmimetypes">.../config/xmlmimetypes</a>		
Java API	Method Name		Class Name
	deleteXmlMimeType		com.quark.qpp.service.facade Class ConfigurationFacade
Parameters	Name	Type	Description
	op=delete	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	mimeType	string	The mimetype to be deleted. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	URL: <a href="http://serverName:serverPort/rest/service/config/xmlmimetypes?op=delete&amp;mimetype=application/xml; format=researchreport">http://serverName:serverPort/rest/service/config/xmlmimetypes?op=delete&amp;mimetype=application/xml; format=researchreport</a>		

### getPublishingProcess

Function	Get publishing process		
Description	This request returns the xml configuration of the process with the given process name.		
Type	GET		
URL Format	<a href=".../config/publishingprocess/{ProcessId}">.../config/publishingprocess/{ProcessId}</a>		
Java API	Method Name		Class Name
	getPublishingProcess		com.quark.qpp.service.facade Class ConfigurationFacade

Parameters	Name	Type	Description
	processName	string	The process name. (Mandatory)
Returns	Returns the xml configuration of the process with the given process name.		
	URL: http://serverName:serverPort/rest/service/config/publishingprocess/researchReportToQxpRenderer Result: <pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;beans xmlns="http://www.springframework.org/schema/beans"&gt; &lt;!-- PROCESS DEFINITIONS --&gt; &lt;pub:process id="researchReportToQxpRenderer"&gt; &lt;pub:activity class="com.quark.qpp.publishing.activity.UnzipXaDocumentPackage"&gt; &lt;description&gt;Unzips and registers XA document file along with the dependencies supplied in the zip file.&lt;/description&gt; &lt;property name="activityName"&gt; &lt;value&gt;UnzipXaDocumentPackage&lt;/value&gt; &lt;/property&gt; ... &lt;/pub:process&gt; &lt;/beans&gt;</pre>		
Examples			

### createPublishingProcess

Function	Create publishing process		
Description	This request creates a new process based on the publishingPocessXML.		
Type	POST		
URL Format	.../config/publishingprocess		
Java API	<b>Method Name</b> <i>createPublishingProcess</i>		<b>Class Name</b> <i>com.quark.qpp.service.facade.ConfigurationFacade</i>
Parameters	<b>Name</b> <i>processxml=[xml]</i>	<b>Type</b> <i>string</i>	<b>Description</b> The publishing process XML (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	URL: http://serverName:serverPort/rest/service/config/publishingprocess ?op=create&processxml=<xml>		

### deletePublishingProcess

Function	Delete publishing process.		
Description	This request deletes the publishing process with the given process name. Deletes the channels where this process is used. Deletes the corresponding configuration file of the process and updates ProcessConfig-ext.xml.		
Type	POST		
URL Format	.../config/publishingprocess/{ProcessName}		
Java API	<b>Method Name</b> <i>deletePublishingProcess</i>		<b>Class Name</b> <i>com.quark.qpp.service.facade.ConfigurationFacade</i>

## REST FRAMEWORK SERVICES

	Name	Type	Description
Parameters	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>processName</code>	string	The name of the process to be deleted. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	URL: <code>http://serverName:serverPort/rest/service/config/publishingprocess/researchReportToQxpRenderer?op=delete</code>		

### getAllPublishingChannelDefinitions

Function	Get all publishing channels	
Description	This request returns all publishing of type publish, deliver and datadoc.	
Type	GET	
URL Format	<code>.../config/publishingchannels</code>	
Java API	Method Name	Class Name
	<code>getAllPublishingChannelDefinitions</code>	<code>com.quark.qpp.service.facade.ConfigurationFacade</code>
Parameters	This request requires no input parameters.	
Returns	Returns a <code>publishingChannelList</code> object that contains the metadata of all publishing channels (Publish, Deliver, Datadoc).	
Examples	URL: <code>http://serverName:serverPort/rest/service/config/publishingchannels</code> Result: <code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt;</code> <code>&lt;publishingChannelList&gt; &lt;publishingChannelInfo id="qppPreviewConvert"</code> <code>name="QPP.PREVIEW.IM.JPG" process="qppPreviewConverter" type="publish"&gt;</code> <code>&lt;parameter name="SOURCE_FILE_EXTENSION" ask="true"&gt;&lt;/parameter&gt;</code> <code>&lt;parameter name="OUTPUT_FILE_NAME" ask="true"&gt;&lt;/parameter&gt;</code> <code>&lt;/publishingChannelInfo&gt; &lt;publishingChannelInfo id="smartDocJpeg"</code> <code>name="QXP.JPEG.ZIP" process="smartDocToQxpRenderer" type="publish"&gt;</code> <code>&lt;parameter name="ASSET_ID" ask="true"&gt;&lt;/parameter&gt; &lt;parameter</code> <code>name="LAYOUT" ask="true"&gt;&lt;/parameter&gt; ..... &lt;/publishingChannelInfo&gt;</code> <code>&lt;/publishingChannelList&gt;</code>	

### getPublishingChannelDefinition

Function	Get publishing channel
Description	This request returns the definition of the publishing channel with the given Id, including the channel Id, name, channel type, the channel's process name and channel parameters.

Type	GET		
URL Format	<code>.../config/publishingchannels/{channelId}</code>		
Java API	Method Name		Class Name
	<code>getPublishingChannelDefinition</code>		<code>com.quark.qpp.service.facade</code> <code>Class ConfigurationFacade</code>
Parameters	Name	Type	Description
	<code>channelId</code>	string	The channel Id of the desired publishing channel. (Mandatory)
Returns	Returns a <code>publishingChannelList</code> object that contains the metadata of the given publishing channel ID.		
Examples	<p>URL:  <code>http://serverName:serverPort/rest/service/config/publishingchannels/smartDocJpeg</code></p> <p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;publishingChannelList&gt; &lt;publishingChannelInfo id="smartDocJpeg" name="QXP.JPEG.ZIP" process="smartDocToQxpRenderer" type="publish"&gt; &lt;parameter name="ASSET_ID" ask="true"&gt;&lt;/parameter&gt; &lt;parameter name="LAYOUT" ask="true"&gt;&lt;/parameter&gt; &lt;parameter name="BOX" ask="true"&gt;&lt;/parameter&gt; &lt;parameter name="SCALE" ask="true"&gt;&lt;/parameter&gt; .... &lt;parameter name="MAX_PAGES" ask="false"&gt;0&lt;/parameter&gt; &lt;parameter name="RESOLVE_QPP_RELATIONS" ask="true"&gt;true&lt;/parameter&gt; &lt;/publishingChannelInfo&gt; &lt;/publishingChannelList&gt;</pre>		

### getPublishingChannelDefinitions

Function	Get the publishing channel for a specific content type.		
Description	This request returns the definition of the publishing channels of type publish, deliver and datadoc that are mapped to a particular content type.		
Type	GET		
URL Format	<code>.../config/publishingchannels</code>		
Java API	Method Name		Class Name
	<code>getPublishingChannelDefinition</code>		<code>com.quark.qpp.service.facade</code> <code>Class ConfigurationFacade</code>
Parameters	Name	Type	Description
	<code>contenttype</code>	string	The content type that is mapped to the desired publishing channel. (Mandatory)
Returns	Returns a <code>publishingChannelList</code> object that contains the metadata of all the publishing channels available for the given content type.		
Examples	<p>URL:  <code>http://serverName:serverPort/rest/service/config/publishingchannels</code>  <code>?contenttype=Smart Document</code></p> <p>Result:</p>		

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<publishingChannelList> <publishingChannelInfo id="smartDocJpeg"
name="QXPJPEG.ZIP" process="smartDocToQxpRenderer" type="publish">
<parameter name="ASSET_ID" ask="true"></parameter> <parameter
name="LAYOUT" ask="true"></parameter> <parameter name="BOX"
ask="true"></parameter> <parameter name="SCALE" ask="true"></parameter> ....
<parameter name="MAX_PAGES" ask="false">0</parameter> <parameter
name="RESOLVE_QPP_RELATIONS" ask="true">true</parameter>
</publishingChannelInfo> </publishingChannelList>
```

### createPublishingChannels

<b>Function</b>	Create new publishing channels		
<b>Description</b>	This request creates new publishing channels as specified in the publishingChannelList.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../config/publishingchannels</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createPublishingChannels</code>		<code>com.quark.qpp.service.facade</code> <code>Class ConfigurationFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>publishingchannellist</code> = [publishingChannelList]	string	The publishing channel list. (Mandatory)
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	<p>URL:</p> <p><code>http://serverName:serverPort/rest/service/config/publishingchannels</code></p> <p>?op=create&amp;publishingchannellist=&lt;publishingChannelList&gt;publishingChannelList</p> <p>Example:&lt;publishingChannelList&gt; &lt;publishingChannelInfo</p> <p>id="researchReportPdf" name="PDF" process="smartDocToQxpRenderer"</p> <p>type="publish"&gt; &lt;parameter name="OUTPUT_STYLE" ask="true"&gt;PDF High</p> <p>Quality&lt;/parameter&gt; &lt;parameter name="ASSET_ID" ask="true"/&gt; &lt;parameter</p> <p>name="QXP_TEMPLATE_URI"</p> <p>ask="true"&gt;classpath:ResearchReportTemplate.qxp&lt;/parameter&gt; &lt;parameter</p> <p>name="RENDER_FORMAT"&gt;PDF&lt;/parameter&gt; &lt;parameter</p> <p>name="EXCEL_DATA_IMAGE_FORMAT"&gt;PDF&lt;/parameter&gt; &lt;parameter</p> <p>name="ANNOTATE_ERRORS"&gt;true&lt;/parameter&gt; &lt;parameter</p> <p>name="TRACKED_CHANGES" ask="true"&gt;ACCEPT&lt;/parameter&gt; &lt;parameter</p> <p>name="XSL_URI" ask="true"&gt;classpath:SmartDoc2QXPS.xslt&lt;/parameter&gt;</p> <p>&lt;parameter name="APPEND_ERRORS" ask="true"&gt;true&lt;/parameter&gt;</p> <p>&lt;/publishingChannelInfo&gt; &lt;publishingChannelInfo id="researchReportJpeg"</p> <p>name="QXPJPEG.ZIP" type="publish" process="smartDocToQxpRenderer"&gt;</p> <p>&lt;parameter name="ASSET_ID" ask="true"/&gt; &lt;parameter name="LAYOUT"</p> <p>ask="true"/&gt; &lt;parameter name="BOX" ask="true"/&gt; &lt;parameter name="SCALE"</p>		

	<pre> ask="true"/&gt; &lt;parameter name="RENDER_FORMAT"&gt;JPEG&lt;/parameter&gt; &lt;parameter name="XSL_URI" ask="true"&gt;classpath:SmartDoc2QXPS.xslt&lt;/parameter&gt; &lt;parameter name="QXP_TEMPLATE_URI" ask="true"&gt;classpath:SmartDocTemplate.qxp&lt;/parameter&gt; &lt;parameter name="EXCEL_DATA_IMAGE_FORMAT" ask="true"&gt;PDF&lt;/parameter&gt; &lt;parameter name="CHART_IMAGE_FORMAT"&gt;PDF&lt;/parameter&gt; &lt;parameter name="VISIO_DATA_IMAGE_FORMAT"&gt;PDF&lt;/parameter&gt; &lt;parameter name="POWERPOINT_DATA_IMAGE_FORMAT"&gt;PDF&lt;/parameter&gt; &lt;parameter name="TRACKED_CHANGES" ask="true"&gt;ACCEPT&lt;/parameter&gt; &lt;parameter name="RESOLVE_QPP_RELATIONS" ask="true"&gt;true&lt;/parameter&gt; &lt;/publishingChannelInfo&gt; &lt;/publishingChannelList&gt;</pre>
--	--

### createContentChannelMappings

<b>Function</b>	Map publishing channel with content type for publishing.		
<b>Description</b>	This request maps content types to channels and updates the “PublishingConfig-ext.xml” file with the new mappings.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../config/publishingchannels</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createContentChannelMappings</code>		<code>com.quark.qpp.service.facade</code> <code>Class ConfigurationFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=mapcontenttype</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>contenttypes</code>	string	The content types to be mapped. (Mandatory)
	<code>channels</code> [comma-separated list of channels]	string	The publishing channels. (Mandatory)
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	URL: <code>http://serverName:serverPort/rest/service/config/publishingchannels</code> <code>?op=mapcontenttype&amp;contenttypes=Research Report</code> <code>&amp;channels=researchReportPdf,researchReportJpeg</code>		

### deleteContentChannelMappings

<b>Function</b>	Delete publishing channel and content type mapping.
<b>Description</b>	This request deletes content types to channel mappings and updates the “PublishingConfig-ext.xml” file. If content type is specified, channel mappings are deleted for this content type only. If content type is not specified, then mappings with all content types of the specified channel are deleted.

## REST FRAMEWORK SERVICES

Type	POST		
URL Format	<code>.../config/publishingchannels</code>		
Java API	Method Name		Class Name
	<code>deleteContentChannelMappings</code>		<code>com.quark.qpp.service.facade</code> <code>Class ConfigurationFacade</code>
Parameters	Name	Type	Description
	<code>op=unmapcontenttype</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>contenttype</code>	string	The content types to be mapped. (Mandatory)
Parameters	<code>channel</code>	string	The publishing channel. (Mandatory)
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	URL: <code>http://serverName:serverPort/rest/service/config/publishingchannels</code> <code>?op=unmapcontenttype&amp;contenttypes=Research Report</code> <code>&amp;channels=researchReportPdf,researchReportJpeg</code>		

### **createIndexingChannelMapping**

Function	Map publishing channel with content type for indexing.		
Description	This request maps content types to indexing channels and updates the “IndexingChannels-ext.xml” file with the new mappings.		
Type	POST		
URL Format	<code>.../config/publishingchannels</code>		
Java API	Method Name		Class Name
	<code>createIndexingChannelMapping</code>		<code>com.quark.qpp.service.facade</code> <code>Class ConfigurationFacade</code>
Parameters	Name	Type	Description
	<code>op=mapindexingchannel</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>contenttype</code>	string	The content types to be mapped. (Mandatory)
	<code>channels[comma-separated list of channels]</code>	string	The indexing channels. (Mandatory)
	<code>parameterMap</code>	string	
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	URL: <code>http://serverName:serverPort/rest/service/config/publishingchannels</code> <code>?op=mapindexingchannel&amp;contenttype=Research Report</code>		

	&channel=researchReportJpeg&QXP_TEMPLATE_URI=classpath:ResearchReportTemplate.qxp
--	---

### getMappedIndexingChannel

<b>Function</b>	Get mapped indexing channels for a given content type.		
<b>Description</b>	This request returns the definition of the indexing channel mapped to the given content type.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../config/publishingchannels</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getMappedIndexingChannel</code>		<code>com.quark.qpp.service.facade.ConfigurationFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>contenttype=[contentTypeIdOrName]</code>	string	The content type. (Mandatory)
	<code>indexingchannel=[true false]</code>	boolean	
<b>Returns</b>	Returns a <code>publishingChannelList</code> object that contains a list of mapped publishing channels and its metadata.		
<b>Examples</b>	URL: <code>http://serverName:serverPort/rest/service/config/publishingchannels?contenttype=Research Report&amp;indexingchannel=true</code>		

### deleteIndexingChannelMapping

<b>Function</b>	Delete publishing channel and content type mapping for indexing.		
<b>Description</b>	This request deletes content type to indexing channel mapping and updates the “IndexingChannels-ext.xml” file. If content type is specified, channel mapping is deleted for the given content type only. If content type is not specified, then mappings with all content types of the specified channel are deleted.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../config/publishingchannels</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>deleteIndexingChannelMapping</code>		<code>com.quark.qpp.service.facade.ConfigurationFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=unmapindexingchannel</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>channel</code>	string	The channel.
	<code>contenttype</code>	string	The content type.

## REST FRAMEWORK SERVICES

<b>Returns</b>	A status of 200 is returned in response to a successful request execution.
<b>Examples</b>	URL: <code>http://serverName:serverPort/rest/service/config/publishingchannels?op=unmapindexingchannel&amp;channel=researchReportJpeg&amp;contenttype=ResearchReport</code>

### deletePublishingChannels

<b>Function</b>	Delete publishing channel.		
<b>Description</b>	This request deletes the channels specified. The “ChannelConfig-ext.xml” file is updated and any mapping for the specified channels is also deleted.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../config/publishingchannels</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>deletePublishingChannels</code>		<code>com.quark.qpp.service.facade Class ConfigurationFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=delete</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>channelids</code>	string	The channel Ids of the channels to be deleted.
<b>Returns</b>	A status of 200 is returned in response to a successful request execution.		
<b>Examples</b>	URL: <code>http://serverName:serverPort/rest/service/config/publishingchannels?op=delete&amp;channelids=researchReportPdf</code>		

### getDeploymentProperties

<b>Function</b>	Get deployment properties		
<b>Description</b>	This request returns all properties specified for the deployment in the “Deployment.properties” file.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../config/deploymentproperties</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getDeploymentProperties</code>		<code>com.quark.qpp.service.facade Class ConfigurationFacade</code>
<b>Parameters</b>	This request requires no input parameters.		
<b>Returns</b>	Returns a <code>nameValueList</code> object that contains all the properties.		
<b>Examples</b>	URL: <code>http://serverName:serverPort/rest/service/config/deploymentproperties</code>		

	<p>Result:</p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;nameValueList&gt; &lt;nameValue name="deployment.version" value="" /&gt; &lt;/nameValueList&gt;</pre>
--	---

### getDeploymentVersion

<b>Function</b>	Get deployment version	
<b>Description</b>	This request returns the version of the custom deployment.	
<b>Type</b>	GET	
<b>URL Format</b>	<code>.../config/deploymentversion</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getDeploymentVersion</code>	<code>com.quark.qpp.service.facade.ConfigurationFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns the text value of the deployment version specified in the "Deployment.properties" file.	
<b>Examples</b>	<p>URL:  <code>http://serverName:serverPort/rest/service/config/deploymentversion</code></p> <p>Result:  1.2</p>	

### reInitialize

<b>Function</b>	ReInitialize	
<b>Description</b>	This request reinitializes the mime-type, channel and process definitions using their config files. It will reinitialize the content-mime-type mappings configuration, content type to channel mappings configuration and content type to indexing channel mappings configuration. This request may be used to apply settings assigned directly to config files without restarting the server.	
<b>Type</b>	POST	
<b>URL Format</b>	<code>.../config/</code>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>reInitialize</code>	<code>com.quark.qpp.service.facade.ConfigurationFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>
	<code>op=reinitializeconfigs</code>	string
	<code>reinitializemimetypes=[true false]</code>	boolean
	<code>reinitializechannels=[true false]</code>	boolean

	<code>reinitializeprocesses</code> =[true false]	boolean	
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	URL: <a href="http://serverName:serverPort/rest/service/config/?op=reinitializeconfigs&amp;reinitializemimetypes=true&amp;reinitializechannels=true&amp;reinitializeprocesses=true">http://serverName:serverPort/rest/service/config/?op=reinitializeconfigs&amp;reinitializemimetypes=true&amp;reinitializechannels=true&amp;reinitializeprocesses=true</a>		

## Clipboard

The Clipboard service is used to manage user-specific clipboard data on the Platform server. The server-side clipboard enables clipboard access across multiple devices and securely maintains data by user; accessible only to the user who copied the data. The service also manages clipboard data conversion to other formats.

The clipboard capabilities of the API includes the following REST calls:

- addClipboardData
- addFormattedData
- getAllClipboardData
- *getAllClipboardDataInfos*
- getAllClipboardFormats
- getClipboardDataInfo
- getClipboardChannelsMappings
- getFormattedData
- getLatestClipboardData
- getLatestClipboardDataInfo
- getLatestFormattedData

### addClipboardData

Function	Add data to clipboard.		
Description	This request adds data to the logged-in user's clipboard and returns info about the data added .		
Type	POST		
URL Format	<code>.../clipboard</code>		
Java API	Method Name	Class Name	
	<code>addClipboardData</code>	<code>com.quark.qpp.service.facade.ClipboardFacade</code>	
Parameters	Name	Type	Description

	<code>op=adddata</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>contenttype=[contentType]</code> or <code>[Name]</code>	string	The content type <b>Id</b> or <b>Name</b> of the data.
	<code>mimetype=[mimeType]</code>	string	The mimeType of the data.
	<code>inputstream</code>	string	The data stream.
<b>Returns</b>	Returns a <code>clipboardDataInfo</code> object in XML format, containing information about the data added to the user's clipboard. See the table in the "Request/Response parameter formats" chapter.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://server:port/rest/service/clipboard?op=adddata&amp;mimetype=application/vnd.openxmlformats-officedocument.spreadsheetml.sheet&amp;contenttype=Microsoft Excel Table&amp;preview=My Excel table preview...&amp;created by=QppAdmin&amp;create on=12th June 2017</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;clipboardDataInfo dataId="24"&gt;     &lt;timestamp&gt;2017-06-12T14:15:34Z&lt;/timestamp&gt;     &lt;contentType id="110171" name="Microsoft Excel Table"/&gt;     &lt;mimeType&gt;application/vnd.openxmlformats-officedocument.spreadsheetml.sheet&lt;/mimeType&gt;     &lt;clipboardMeta&gt;         &lt;nameValue name="preview" value="My Excel table preview..."/&gt;         &lt;nameValue name="create on" value="12th June 2017"/&gt;         &lt;nameValue name="created by" value="QppAdmin"/&gt;     &lt;/clipboardMeta&gt; &lt;/clipboardDataInfo&gt;</pre>		

## addFormattedData

<b>Function</b>	Add formatted data.		
<b>Description</b>	This request adds formatted-data to the logged-in user's clipboard for the data corresponding to the data Id.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../clipboard/{dataId}</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>addFormattedData</code>	<code>com.quark.qpp.service.facade.ClipboardFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=addformatteddata</code>	string	The op parameter allows you to specify which operation is to be performed.

## REST FRAMEWORK SERVICES

			(Mandatory)
	inputstream	string	The data stream.
	format	string	The format of the data.
Returns	A status of 200 is returned in response to a successful request execution.		
Examples	<b>URL:</b> <a href="http://server:port/rest/service/clipboard/24?op=addformatteddata&amp;format=jpeg">http://server:port/rest/service/clipboard/24?op=addformatteddata&amp;format=jpeg</a>		

### getAllClipboardChannelsMapping

<b>Function</b>	Get all clipboard channel mappings.	
<b>Description</b>	This request retrieves all of the clipboard format to channel mappings.	
<b>Type</b>	GET	
<b>URL Format</b>	<a href=".../clipboard/channelsmapping">.../clipboard/channelsmapping</a>	
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>
	<code>getAllClipboardChannelsMapping</code>	<code>com.quark.qpp.service.facade.ClipboardFacade</code>
<b>Parameters</b>	This request requires no input parameters.	
<b>Returns</b>	Returns a <code>clipboardChannelMappingInfoList</code> object in XML format, containing a list of all clipboard format to channel mappings.	
<b>Examples</b>	<b>URL:</b> <a href="http://server:port/rest/service/clipboard/channelsmapping">http://server:port/rest/service/clipboard/channelsmapping</a>  <b>Result:</b> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;clipboardChannelMappingInfoList&gt;     &lt;clipboardChannelMappingInfo id="fetchExcelTable"         contentType="Microsoft Excel Table" clipboardFormat="svg"&gt;         &lt;channelParameters&gt;             &lt;nameValue name="OUTPUT_FORMAT" value="image"/&gt;             &lt;nameValue name="OUTPUT_FORMAT_PROPERTIES"                 value="imageformat(svg)"&gt;         &lt;/channelParameters&gt;</pre>	

	<pre> &lt;/channelParameters&gt; &lt;/clipboardChannelMappinInfo&gt; &lt;clipboardChannelMappingInfo id="fetchExcelTable" contentType="Microsoft Excel Table" clipboardFormat="png"/&gt; &lt;channelParameters&gt;     &lt;nameValue name="OUTPUT_FORMAT" value="image"/&gt;     &lt;nameValue name="OUTPUT_FORMAT_PROPERTIES" value="imageformat/png"/&gt; &lt;/channelParameters&gt; &lt;/clipboardChannelMappinInfo&gt; ..... &lt;/clipboardChannelMappingInfoList&gt;</pre>
--	---

### getAllClipboardDataInfos

<b>Function</b>	Get all clipboard data information.		
<b>Description</b>	This request fetches information about all the data present in the logged-in user's clipboard.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../clipboard</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getAllClipboardDataInfos</code>		<code>com.quark.qpp.service.facade.ClipboardFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>metadata=true</code>	boolean	(Mandatory)
<b>Returns</b>	Returns a <code>clipboardDataInfoList</code> object in XML format, containing information about all the data present in the user's clipboard.		
<b>Examples</b>	<p><b>URL:</b></p> <code>http://server:port/rest/service/clipboard? metadata=true</code> <p><b>Result:</b></p> <pre> &lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;clipboardDataInfoList&gt;     &lt;clipboardDataInfo dataId="24"&gt;         &lt;timestamp&gt;2017-06-12T14:15:34Z&lt;/timestamp&gt;         &lt;contentType id="110171" name="Microsoft Excel Table"/&gt;         &lt;mimeType&gt;application/vnd.openxmlformats-officedocument.spreadsheetml.sheet&lt;/mimeType&gt;         &lt;clipboardMeta&gt;             &lt;nameValue name="preview" value="My Excel table preview..."/&gt;             &lt;nameValue name="create on" value="12th June 2017"/&gt;             &lt;nameValue name="created by" value="QppAdmin"/&gt;         &lt;/clipboardMeta&gt;     &lt;/clipboardDataInfo&gt; &lt;/clipboardDataInfoList&gt;</pre>		

### getAllClipboardFormats

<b>Function</b>	Get all clipboard formats
-----------------	---------------------------

## REST FRAMEWORK SERVICES

<b>Description</b>	This request returns all the data formats supported for clipboard data.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../clipboard/formats</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>getAllClipboardFormats</code>	<code>com.quark.qpp.service.facade.ClipboardFacade</code>	
<b>Parameters</b>	This request requires no input parameters		
<b>Returns</b>	Returns a <code>clipboardFormatInfoList</code> object containing an array of all the clipboard data formats in XML format. See the table in the “Request/Response parameter formats” chapter.		
<b>Examples</b>	<p><b>URL:</b>  <code>http://server:port/rest/service/clipboard/formats</code></p> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8"?&gt; &lt;clipboardFormatInfoList&gt;   &lt;clipboardFormatInfo&gt;     &lt;name&gt;svg&lt;/name&gt;     &lt;mimeType&gt;image/svg+xml&lt;/mimeType&gt;   &lt;/clipboardFormatInfo&gt;   &lt;clipboardFormatInfo&gt;     &lt;name&gt;png&lt;/name&gt;     &lt;mimeType&gt;image/png&lt;/mimeType&gt;   &lt;/clipboardFormatInfo&gt;   &lt;clipboardFormatInfo&gt;     &lt;name&gt;jpeg&lt;/name&gt;     &lt;mimeType&gt;image/jpeg&lt;/mimeType&gt;   &lt;/clipboardFormatInfo&gt;   &lt;clipboardFormatInfo&gt;     &lt;name&gt;pdf&lt;/name&gt;     &lt;mimeType&gt;application/pdf&lt;/mimeType&gt;   &lt;/clipboardFormatInfo&gt;   &lt;clipboardFormatInfo&gt;     &lt;name&gt;cals&lt;/name&gt;     &lt;mimeType&gt;application/xml&lt;/mimeType&gt;   &lt;/clipboardFormatInfo&gt; &lt;/clipboardFormatInfoList&gt;</pre>		

### getClipboardDataInfo

<b>Function</b>	Get clipboard data information.		
<b>Description</b>	This request fetches information about the logged-in user's clipboard data using the data Id.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../clipboard/{dataId}</code>		
<b>Java API</b>	<b>Method Name</b>	<b>Class Name</b>	
	<code>getClipboardDataInfo</code>	<code>com.quark.qpp.service.facade.ClipboardFacade</code>	
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>metadata=true</code>	boolean	(Mandatory)

<b>Returns</b>	Returns a <code>clipboardDataInfo</code> object in XML format, containing information about the clipboard data using the data <b>Id</b> .
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://server:port/rest/service/clipboard/24? metadata=true</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;clipboardDataInfo dataId="24"&gt;     &lt;timestamp&gt;2017-06-12T14:15:34Z&lt;/timestamp&gt;     &lt;contentType id="110171" name="Microsoft Excel Table"/&gt;     &lt;mimeType&gt;application/vnd.openxmlformats-officedocument.spreadsheetml.sheet&lt;/mimeType&gt;     &lt;clipboardMeta&gt;         &lt;nameValue name="preview" value="My Excel table preview..."/&gt;         &lt;nameValue name="create on" value="12th June 2017"/&gt;         &lt;nameValue name="created by" value="QppAdmin"/&gt;     &lt;/clipboardMeta&gt; &lt;/clipboardDataInfo&gt;</pre>

### getClipboardChannelsMapping

<b>Function</b>	Get clipboard channel mappings for content type.		
<b>Description</b>	This request returns the clipboard format to channel mappings based on the content type.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../clipboard/channelsmapping</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getClipboardChannelsMapping</code>		<code>com.quark.qpp.service.facade.ClipboardFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>contenttype=contentTy</code> <code>peIdOrName</code>	string	The content type.(Mandatory)
<b>Returns</b>	Returns a <code>clipboardChannelMappingInfoList</code> object in XML format.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://server:port/rest/service/clipboard/channelsmapping?content type=Microsoft Excel Table</pre> <p><b>Result:</b></p> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;clipboardChannelMappingInfoList&gt;     &lt;clipboardChannelMappingInfo id="fetchExcelTable"         contentType="Microsoft Excel Table" clipboardFormat="svg"&gt;         &lt;channelParameters&gt;             &lt;nameValue name="OUTPUT_FORMAT" value="image"/&gt;             &lt;nameValue name="OUTPUT_FORMAT_PROPERTIES"                 value="imageformat=svg"/&gt;         &lt;/channelParameters&gt;     &lt;/clipboardChannelMappingInfo&gt;     &lt;clipboardChannelMappingInfo id="fetchExcelTable"         contentType="Microsoft Excel Table" clipboardFormat="png"&gt;         &lt;channelParameters&gt;</pre>		

## REST FRAMEWORK SERVICES

	<pre>&lt;nameValue name="OUTPUT_FORMAT" value="image"/&gt; &lt;nameValue name="OUTPUT_FORMAT_PROPERTIES" value="imageformat/png"/&gt; &lt;/channelParameters&gt; &lt;/clipboardChannelMappingInfo&gt; ..... &lt;/clipboardChannelMappingInfoList&gt;</pre>
--	--

### getFormattedData

<b>Function</b>	Get formatted data.		
<b>Description</b>	This request retrieves formatted data based on the data Id and format. The formatted data is retrieved by using default Channel Mappings if no publishing channel parameter is specified.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../clipboard/{dataId}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getFormattedData</code>		<code>com.quark.qpp.service.facade.ClipboardFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>format</code>	string	The format in which clipboard data is to be retrieved.
	<code>publishingchannel</code>	string	The publishing channel Id.
	<code>parametersMap</code>	string	The publishing channel parameters.
	<code>contentdisposition</code>		The content disposition value to be set on the http response header.
	<code>outputStream</code>	string	The output stream onto which output is to be written (for local API invocations).
<b>Returns</b>	Returns a stream of formatted data.		
<b>Examples</b>	<b>URL:</b> <code>http://server:port/rest/service/clipboard/24? format=png</code>		
	<b>Result:</b> A filestream of the required output format based on given parameters.		

### getLatestClipboardData

<b>Function</b>	Get latest clipboard data.
<b>Description</b>	This request retrieves the latest data that was added to the logged-in user's clipboard.
<b>Type</b>	GET

<b>URL Format</b>	<code>.../clipboard</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getLatestClipboardData</code>		<code>com.quark.qpp.service.facade.ClipboardFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>contentDisposition</code>	string	The content disposition value to be set on the http response headers.
<b>Returns</b>	The output stream onto which output is to be written (for local API invocations).		
	Returns a stream of copied data into server.		
<b>Examples</b>	<b>URL:</b> <code>http://server:port/rest/service/clipboard</code> <b>Result:</b> A filestream of the latest copied data.		

### getLatestClipboardDataInfo

<b>Function</b>	Get latest clipboard data information.		
<b>Description</b>	This request fetches information about the latest data that was added to the logged-in user's clipboard.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../clipboard</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getLatestClipboardDataInfo</code>		<code>com.quark.qpp.service.facade.ClipboardFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>metadata=true</code>	boolean	
<b>Returns</b>	Returns a <code>clipboardDataInfo</code> object in XML format, containing information about the latest data added to the user's clipboard . See the table in the "Request/Response parameter formats" chapter.		
	<b>URL:</b> <code>http://server:port/rest/service/clipboard?</code> <code>metadata=true&amp;latest=true</code> <b>Result:</b> <pre>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;clipboardDataInfo dataId="24"&gt;     &lt;timestamp&gt;2017-06-12T14:15:34Z&lt;/timestamp&gt;     &lt;contentType id="110171" name="Microsoft Excel Table"/&gt;     &lt;mimeType&gt;application/vnd.openxmlformats-officedocument.spreadsheetml.sheet&lt;/mimeType&gt;</pre>		
<b>Examples</b>			

	<pre> &lt;clipboardMeta&gt;     &lt;nameValue name="preview" value="My Excel table preview..."/&gt;     &lt;nameValue name="create on" value="12th June 2017"/&gt;     &lt;nameValue name="created by" value="QppAdmin"/&gt; &lt;/clipboardMeta&gt; &lt;/clipboardDataInfo&gt;</pre>
--	--

**getLatestFormattedData**

<b>Function</b>	Get latest formatted data.		
<b>Description</b>	This request retrieves the latest data added to the logged-in user's clipboard in the specified format. The formatted data is retrieved by using default Channel Mappings if no publishing channel parameter is specified.		
<b>Type</b>	GET		
<b>URL Format</b>	<code>.../clipboard</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>getLatestFormattedData</code>		<code>com.quark.qpp.service.facade.ClipboardFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>format</code>	string	The format in which clipboard data is to be retrieved.
	<code>publishingchannel</code>	string	The publishing channel Id.
	<code>parametersMap</code>	string	The publishing channel parameters.
	<code>contentdisposition</code>		The content disposition value to be set on the http response header.
	<code>outputStream</code>	string	The output stream onto which output is to be written (for local API invocations).
<b>Returns</b>	Returns a stream of formatted data.		
<b>Examples</b>	<b>URL:</b> <code>http://server:port/rest/service/clipboard? format=png</code>		
	<b>Result:</b> A filestream of the required output format based on given parameters.		

**promoteClipboardDataToAsset**

<b>Function</b>	Promote clipboard data to asset
<b>Description</b>	This request promotes the user's clipboard data to Platform's asset.
<b>Type</b>	POST

<b>URL Format</b>	<code>.../clipboard/{dataId}</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>promoteClipboardDataToAsset</code>		<code>com.quark.qpp.service.facade.ClipboardFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=promotetoasset</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>createminorversion</code>	boolean	
	<code>attributevalues</code>	string	
<b>Returns</b>	Returns an <code>assetInfo</code> object in XML format, containing the metadata of the newly created asset. See the table in the “Request/Response parameter formats” chapter.		
<b>Examples</b>	<p><b>URL:</b></p> <pre><code>http://server:port/rest/service/clipboard/{DataId}?loginname=Admin&amp;loginpassword=Admin&amp;op=promotetoasset&amp;attributevalues=&lt;xml/&gt;</code></pre> <p><b>RESULT:</b></p> <pre><code>&lt;?xml version="1.0" encoding="UTF-8" standalone="yes"?&gt; &lt;assetInfo id="220"&gt;     &lt;assetVersion majorVersion="1" minorVersion="0"/&gt;     &lt;attributeValueList&gt;         &lt;attributeValue id="1" name="Id" type="numeric"&gt;220&lt;/attributeValue&gt;         .....         &lt;/attributeValueList&gt;         &lt;articleComponentInfoList/&gt;     &lt;/assetInfo&gt;</code></pre>		

# JSON support in request parameters for POST requests.

Both XML and JSON can be used to pass request parameters.

The following are some examples:

## **createCollection**

<b>Function</b>	Create a collection.		
<b>Description</b>	This request creates a new collection according to the given attributes.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../collections/[collection name] or collectionsbypath/[collection path]</code>		
<b>Header</b>	<code>qpp-content-type:json</code>		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createCollection</code>		<code>com.quark.qpp.service.facade Class CollectionFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>targetparent=[collection path or ID]</code>	long or string	The parent collection for the new collection. (Mandatory)There is a choice between collection ID, Name and Path when providing a value.
	<code>attributevalues=&lt;xml/&gt;</code>	string	The set of attribute values.: See “Request/Response parameter formats.”(All attributes are Optional)
	<code>contenttype=[content type name]</code>	string	Defaults to <code>GENERAL</code> . The default content type IDs are documented in the JavaDoc SDK at <code>com.quark.qpp.core.content.service.constants.DefaultContentTypes</code> . To get a list of content types, use a call to <code>../admin/contenttypes</code> . (Optional)There is a choice between content type ID, Name and Hierarchy when providing a value.

Returns	Returns the <code>collectionInfo</code> object of the newly created collection.
URL:	<pre>http://serverName:serverPort/rest/service/collections? op=create&amp;collectioninfolist= {"CollectionInfoList": {"collectionInfo": [{"assetInfoList":null, "attributeValueList": { "attributeValue": [{"id":2,"multiValued":false,"name":"", "sourceReference":null,"type":"", "value":"Collection_5800a","valueId":0},  {"id":59,"multiValued":false,"name":"", "sourceReference":null,"type":"", "value":"Home/Collection_5800a","valueId":0},  {"id":62,"multiValued":false,"name":"", "sourceReference":null,"type":"", "value":false,"valueId":0},  {"id":57,"multiValued":false,"name":"", "sourceReference":null,"type":"", "value":"Home/Collection_5800a","valueId":0},  {"id":19,"groupInfoList":null,"id":0, "jobJacketInfoList":null,"name":"Collection_5800a", "parentColInfoList":null,"revisionControlInfoList":null, "routingInfoList":null,"templateId":0,"userInfoList":null, "workflowInfoList":null} ] } }Input:{ "CollectionInfoList": { "collectionInfo": [{"assetInfoList":null, "attributeValueList": {"attributeValue": [ {"id":2,"multiValued":false,"name":"", "sourceReference":null,"type":"", "value":"Collection_5800a","valueId":0},  {"id":59,"multiValued":false,"name":"", "sourceReference":null,"type":"", "value":false,"valueId":0},  {"id":57,"multiValued":false,"name":"", "sourceReference":null,"type":"", "value":"Home/Collection_5800a","valueId":0},  {"id":62,"multiValued":false,"name":"", "sourceReference":null,"type":"", "value":false,"valueId":0},  {"id":57,"multiValued":false,"name":"", "sourceReference":null,"type":"", "value":"Home/Collection_5800a","valueId":0},  {"id":19,"groupInfoList":null,"id":0, "jobJacketInfoList":null,"name":"Collection_5800a", "parentColInfoList":null,"revisionControlInfoList":null, "routingInfoList":null,"templateId":0,"userInfoList":null, "workflowInfoList":null} ] } }</pre>
Examples	

### checkinNew

Function	Check in a new asset.
Description	Include the file in the request body or as file part.
Type	POST
URL Format	<code>.../assetsbypath/[asset path] or /assets/[New Asset Name]</code>
Header	<code>qpp-content-type: json</code>

## JSON SUPPORT IN REQUEST PARAMETERS FOR POST REQUESTS.

Java API	Method Name		Class Name
	checkInNew		com.quark.qpp.service.facade Class AssetFacade
Parameters	Name	Type	Description
	op=checkinnew	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	attributevalues		See "checkinNewRequest/Response parameter formats." The following attributes are Mandatory:Content type (There is a choice between content type ID, Name and Hierarchy when providing a value for the Content type) attribute. Collection (There is a choice between collection ID, Name and Path when providing a value for the Collection attribute). WorkflowStatusFile extensionOriginal filename
	relations		See "Request/Response parameter formats." If this parameter is passed, the Platform Server will check-in the asset and create child relations with the new asset being checked in at the same time. (Optional).
	createminorversion =[true   false]	boolean	Specify if this version of the asset is to be checked in to the QPP server as a major or a minor version. (Optional)
Returns	Returns an assetInfo object of the newly checked in asset with its metadata.		
Examples	<p>URL:</p> <pre>http://myplatform:61400/rest/service/assets/Platform 11.2 What's New.pptx? op=checkinnew&amp;attributevalues={"AttributeValueList":{...}} Input:{ "AttributeValueList": { "attributeValue": [ { "id":62, "multiValued":false, "name":"", "sourceReference":null, "type":"", "value":"System;Asset;Project;QuarkXPress Project;"}, {"valueId":0 }, { "id": 54, "multiValued": false, "name": "", "sourceReference": null, "type": "", "value": null, "valueId": 11 }, { "id": 24, "multiValued": false, "name": "", "sourceReference": null, "type": "", "value": null, "valueId": 13 }, { "id": 33, "multiValued": false, "name": "", "sourceReference": null, "type": "", "value": "15116.qxp", "valueId": 0 }, { "id": 25, "multiValued": false, "name": "", "sourceReference": null, "type": "", "value": null, "valueId": 1 }, { "id": 11, "multiValued": false, "name": "", "sourceReference": null, "type": "", "value": "qxp", "valueId": 0 }, { "id": 55, "multiValued": false, "name": "", "sourceReference": null, "type": "", "value": null, "valueId": 1 } ] } }</pre>		

**createDomains**

<b>Function</b>	Create Attribute Domains.		
<b>Description</b>	This request is used to create a single or multiple attribute domains at one time.		
<b>Type</b>	POST		
<b>URL Format</b>	<code>.../admin/domains</code>		
<b>Header</b>	qpp-content-type: json		
<b>Java API</b>	<b>Method Name</b>		<b>Class Name</b>
	<code>createDomains</code>		<code>com.quark.qpp.service.facade</code> <code>Class AdminFacade</code>
<b>Parameters</b>	<b>Name</b>	<b>Type</b>	<b>Description</b>
	<code>op=create</code>	string	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	<code>attributedomaininfolist</code>	string	List of attribute domains to create.
<b>Returns</b>	Returns a <code>attributeDomainInfoList</code> object containing a list of successfully created attribute domains.		
<b>Examples</b>	<p><b>URL:</b></p> <pre>http://myplatform:61400/rest/service/admin/domains? op=create&amp;attributedomaininfolist= Input: {AttributeDomainInfoList": {"attributeDomainInfo": [{"domainValueList": {"domainValue": [{"domainValueList": {"domainValue": [{"domainValueList": {"domainValue": [{"id": 0, "name": "7", "sourceReference": "source7", "valueHierarchy": null } ] }, "id": 0, "name": "4", "sourceReference": "source4", "valueHierarchy": null } ] }, "id": 0, "name": "1", "sourceReference": "source1", "valueHierarchy": null }, {"domainValueList": {"domainValue": [{"domainValueList": {"domainValue": [{"id": 0, "name": "8", "sourceReference": "source8", "valueHierarchy": null } ] }, "id": 0, "name": "5", "sourceReference": "source5", "valueHierarchy": null } ] }, "id": 0, "name": "2", "sourceReference": "source2", "valueHierarchy": null }, {"domainValueList": {"domainValue": [{"domainValueList": {"domainValue": [{"id": 0, "name": "9", "sourceReference": "source9", "valueHierarchy": null } ] }, "id": 0, "name": "6", "sourceReference": "source6", "valueHierarchy": null } ] }, "id": 0, "name": "3", "sourceReference": "source3", "valueHierarchy": null } ] }, "expandable": true, "hierarchical": true, "id": 0, "itemsSorted": false, "name": "SampleQPP_0cb", "sourceReference": null, "systemDefined": false, "userModifiable": false, "warnBeforeExpansion": true } ] }</pre>		

**createSearches**

<b>Function</b>	Create searches.
<b>Description</b>	This request creates a single or multiple searches at one time.

## JSON SUPPORT IN REQUEST PARAMETERS FOR POST REQUESTS.

Type	POST		
URL Format	.../searchdefinitions		
Header	qpp-content-type: json		
Java API	Method Name		Class Name
	createSearches		com.quark.qpp.service.facade Class QueryDefinitionFacade
Parameters	Name	Type	Description
	op=create	long	The op parameter allows you to specify which operation is to be performed. (Mandatory)
	searchinfolist=[xml]	string	An XML object containing metadata of searches to be created.
Returns	Returns a searchInfoList object containing metadata of newly created searches.		
Examples	<p>URL:</p> <pre>http://myplatform:61400/rest/service/searchdefinitions? op=create&amp;searchinfolist= Input: {"SearchInfoList": {"searchInfo": [{"id": 0,"owner": {"id": 0, "value": null}, "parameterized": false, "queryConditionList": [{"queryCondition":[]}, "queryContext": {"collections": [{"collection": [{"id": 0,"name": "Home","path": null}], "recursive": true }, "context": "ASSET" }, "queryDisplay": {"displayColumnList": {"displayColumn": [{"attributeColumn": true, "columnId": 2, "value": null, "width": 0 }, {"attributeColumn": true, "columnId": 55, "value": null, "width": 0 }, {"attributeColumn": true, "columnId": 54, "value": null, "width": 0 }, {"attributeColumn": true, "columnId": 24, "value": null, "width": 0 } ] }, "displayMode": "PLAIN", "exploreMode": "PLAIN", "groupingAttributeList": {"groupingAttribute": [{"attributeId": 55, "order": "ascending", "value": null } ] }, "sortInfoList": {"sortInfo": [{"attributeColumn": true, "columnId": 2, "order": "ascending", "value": null } ] } }, "searchName": "SampleQuery_90d", "trusteeInfoList": {"trusteeInfo": null} ] } }</pre>		

# Change Log

## Changes in version 11.0

Changes in version 11.0 included the following:

### Additions

The following additions were made to the REST API in version 11.0.

Service	Method Name	Function	Reference
Collection facade	getApplicablePrivileges	Get applicable privileges for the logged in user.	“Collection Management”
	getApplicableRoutingGroups	Get applicable routing groups for the logged in user.	
	getApplicableAttributeConstraints	Get applicable attribute constraints for the logged in user.	
	getApplicableStatusTransition	Get applicable status transitions for the logged in user.	
	getApplicableWorkflowInitialStatuses	Get applicable workflow initial statuses.	
Admin facade	updateUserEnabled	Enables/disables the Platform Server Logon for the given user.	“Administration”
	getGroupsWithGivenUserClass	Get groups with the given role.	
	getUserGroups	Get groups of a user.	
	getLdapGroups	Get LDAP groups.	
	importGroupsFromLdap	Get LDAP groups.	
	synchronizeLdapUsersGroups	Synchronize all LDAP users and groups.	
	synchronizeLdapUsersGroupsBasedOnProfile	Synchronize all LDAP users and groups.	
	createLdapSearches	Create LDAP search definitions.	
	getLdapSearch	Get LDAP search definition.	
	getAllLdapSearches	Get all saved LDAP search definitions.	
	updateLdapSearches	Update LDAP search definitions.	

## CHANGE LOG

Service	Method Name	Function	Reference
	deleteLdapSearch	Delet an LDAP search definition.	
	updateTrusteeRule	Update role for the given trustee.	
	getApplicableApplicationPrivileges	Get applicable application privileges for the logged in user.	
	getApplicablecontentPrivileges	Get applicable content privileges for the logged in user.	

### Changes

- The `userInfo` XML has been modified to support LDAP groups functionality.
- The `groupInfo` XML has been modified to support LDAP groups functionality.
- The `trusteeInfo` XML has been modified to support LDAP groups functionality.
- The `domainValue` XML has been modified to populate a new element, `valueHierarchy` referring to the hierarchy of a domain value.
  - Population of this unique domain value hierarchy is helpful in asset metadata update when the domain value id is not known and there exists multiple domain values with the same name.
- The `ldapProfileInfo` XML has been modified to support LDAP groups functionality.
- In order to set the attribute value of a domain type attribute during check in of an asset: asset metadata update, asset checkout etc., the `attributeValue` XML has been enhanced to support the following options in priority:
  - Specify domain value via hierarchy:

```
<attributeValueList>
  <attributeValue
    name="Departments">Enterprise;Server</attributeValue>
</attributeValueList>
```

- Specify domain value via name:

```
<attributeValueList>
  <attributeValue
    name="Departments">Server</attributeValue>
</attributeValueList>
```

- Specify domain value via id:

```
<attributeValueList>
  <attributeValue name="Departments"
  valueId="1"></attributeValue>
</attributeValueList>
```

- If the CDATA has a value mentioned, it will be assumed to be a domain value hierarchy first and if not resolved, then a domain value name. The valueId

attribute will only be considered if the CDATA is empty for that <attributeValue> node for a domain type attribute.

## Deletions

- The `getOverriddenUserClass(long collectionId)` request has been removed.

In the current model, a users privileges is a union of the following roles:

- Role of the logged in user in the given collection, only if the user is mapped to the given collection.
- Role of collection mapped groups of which the logged in user is a member.

The `getApplicablePrivileges` request should be used to get applicable privileges for the logged in user for the given collection.

## Changes in version 11.2

### Changes

- Added support for JSON format.

## Changes in version 12.0

Changes in version 12.0 included the following:

### Additions

The following additions were made to the REST API in version 12.0.

Service	Method Name	Function	Reference
Asset facade	generateTextIndexesOfAllAssets	Generate text indexes for all assets.	“Asset Management”
	generateTextIndexes	Generate text indexes for a specified asset.	
Office facade	getVisioPagesInfo	Get metadata of all pages of a Visio asset.	“Office”
	getVisioPagesInfoBasedOnURI	Get metadata of all pages of a Visio asset based on URI.	
	getVisioPagesInfoBasedOnStreamContext	Get metadata of all pages of a Visio asset based on stream.	
	getVisioPageOutput	Get page output of a Visio asset.	
	getVisioPageOutputBasedOnURI	Get metadata of all pages of a Visio asset based on URI.	
	getVisioPageOutputBasedOnStreamContext	Get page output of a Visio asset based on stream.	
	getPowerPointSlidesInfo	Get metadata of all slides of a	

## CHANGE LOG

Service	Method Name	Function	Reference
PowerPoint API		PowerPoint asset.	
	getPowerPointSlidesInfoBasedOnURI	Get metadata of all slides of a PowerPoint asset based on URI.	
	getPowerPointSlidesInfoBasedOnStreamContext	Get metadata of all slides of a PowerPoint asset based on file stream.	
	getPowerPointSlideOutput	Get slide output of a PowerPoint asset.	
	getPowerPointSlideOutputBasedOnURI	Get slide output of a PowerPoint asset based on URI.	
	getPowerPointSlideOutputBasedOnStreamContext	Get slide output of a PowerPoint asset based on file stream.	
	getPowerPointSlideRangeOutput	Get slide range output of a PowerPoint asset.	
	getPowerPointSlideRangeOutputBasedOnURI	Get slide range output of a PowerPoint asset based on URI.	
	getPowerPointSlideRangeOutputBasedOnStreamContext	Get slide range output of a PowerPoint asset based on file stream.	
Configuration facade	getAllXmlMimeTypes	Get XML MimeTypes	“Configuration”
	getXmlMimeType	Get XML MimeType	
	createXmlMimeType	Create a custom XML MimeType.	
	getMappedMimeTypes	Get mapped MimeTypes	
	mapMimeTypes	Map custom XML MimeType with ContentType.	
	unmapMimeTypes	Unmap custom XML MimeType with ContentType.	
	deleteXmlMimeType	Delete custom XML MimeType.	
	getPublishingProcess	Get publishing process	
	createPublishingProcess	Create publishing process	
	deletePublishingProcess	Delete publishing process.	
	getAllPublishingChannelDefinitions	Get all publishing channels	
	getPublishingChannelDefinition	Get publishing channel	
	getPublishingChannelDefinitions	Get the publishing channel of a specific content type.	
	createpublishingChannels	Create new publishing channels	
	createContentChannelMappings	Map publishing channel with content type for publishing.	
	deleteContentChannelMappings	Delete publishing channel and content type mapping.	
	createIndexingChannelMappings	Map publishing channel with content	

Service	Method Name	Function	Reference
	g	type for indexing.	
	getMappedIndexingChannel	Get mapped indexing channels for a given content type.	
	deleteIndexingChannelMapping	Delete publishing channel and content type mapping for indexing.	
	deletePublishingChannels	Delete publishing channel.	
	getDeploymentProperties	Get deployment properties	
	getDeploymentVersion	Get deployment version	
	reInitialize	ReInitialize the MimeType	

## Changes in version 13.0

Changes in version 13.0 included the following:

The `PublishingFacade` bean API has been updated which could result in a compile error if using this as a Spring bean.

The method signatures in `PublishFacade` and `PublishByPathFacade` were modified by adding the `httpServletResponse` argument. This affects the following REST calls:

- `publishAsset`
- `publishBasedOnServletContext`
- `publishBasedOnURI`
- `executeDatadocChannel`

This argument sets the appropriate content-type header values in the http response for publishing requests.

Although this change impacts no REST URLs, any custom code using these methods by injecting `PublishFacade` and `PublishByPathFacade` as a Spring bean will encounter compile errors. These errors can be avoided by passing the argument as null.

## Additions

The following additions were made to the REST API in version 13.0.

Service	Method Name	Function	Reference
Office facade	getExcelChart	Get Microsoft Excel chart	“Office”
	getExcelChartBasedOnStream	Get Microsoft Excel chart based on stream	

## CHANGE LOG

Service	Method Name	Function	Reference
	getExcelChartBasedOnURI	Get Microsoft Excel chart based on URI	
	getExcelTable	Get Microsoft Excel table	
	getExcelTableBasedOnStream	Get Microsoft Excel table based on stream	
	getExcelTableBasedOnURI	Get Microsoft Excel table based on URI	
Clipboard facade	addClipboardData	Add data to clipboard	“Clipboard”
	addFormattedData	Add formatted data	
	getAllClipboardChannelsMapping	Get all clipboard format to channel mappings	
	getAllClipboardDataInfos	Get all clipboard data information.	
	getAllClipboardFormats	Get all clipboard formats	
	getClipboardDataInfo	Get clipboard data information	
	getClipboardChannelsMappings	Get clipboard channel mappings for content type	
	getFormattedData	Get formatted data	
	getLatestClipboardData	Get latest clipboard data	
	getLatestClipboardDataInfo	Get latest clipboard data information	
	getLatestFormattedData	Get latest formatted data	

## Changes in version 13.1

Changes in version 13.1 included the following:

### Additions

The following additions were made to the REST API in version 13.1.

Service	Method Name	Function	Reference
Clipboard facade	promoteClipboardDataToAsset	Promote clipboard data to asset.	“ <a href="#">Clipboard</a> ”

# Contacting Quark

The support portal allows you to log support tickets, track tickets, receive status notifications, chat with a technical support representative, search the Knowledge Base, and access product documentation.

With direct access to documentation across all Quark software - from QuarkXPress and App Studio to Quark Enterprise Solutions - you can find answers to your questions at your convenience. Our support team is also available to help, either through our support portal, or via phone for our maintenance contract customers.

If you are a Quark customer and have a current maintenance or support contract your account has already been created for you using your registered email address. If you do not have a support contract you can purchase a single support incident to get your problem resolved. If you have purchased or registered a supported product, you are eligible for free support for the first 90 days.

## In the Americas

For more details, please check out our support website [www.quark.com/support](http://www.quark.com/support)

## Outside the Americas

For countries outside the Americas, please visit the following sites to access your support account:
